802.3 issues

- Qbb frame issues
  - Current proposal uses the PAUSE destination address and MAC control Ethertype.
  - Not friendly to leveraging for use in other MACs.
  - That destination address is now designated by 802.1 for MAC specific use.
    - Other MACs can use it other ways.
  - DA might get changed to one of the 802.1 bridge-scoped addresses
  - Ethertype may be replaced.
802.1 specifies three addresses that connect different scopes of bridges

- Which should be used for Pause?
  - Nearest? Yes if the TPMRs are supporting the traffic classes
- Also applies to LLDP used for DCBX
