Re: [Response to Call for Contributions on IEEE 802.15.4a Channel Models]

Abstract: [This contribution describes the UWB channel measurement results in indoor residential environment based in several types of high-rise apartments. It consists of detailed characterization of the frequency-domain parameters, temporal-domain parameters, small-scale amplitude statistics and S-V clustering multipath channel parameters of the UWB channel with bandwidth from 3 to 10 GHz.]

Purpose: [Contribution towards the IEEE 802.15.4a Channel Modeling Subgroup.]

Notice: This document has been prepared to assist the IEEE P802.15. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release: The contributor acknowledges and accepts that this contribution becomes the property of IEEE and may be made publicly available by P802.15.

UWB Channel Model for Indoor Residential Environment

Outline

- Measurement Setup & Environment
- Data Analysis & Post-Processing
- Measurement Results
- Large-Scale Parameters
- Small-Scale Parameters
- Conclusion

Measurement Setup (1)

- Frequency domain technique using VNA
 - Center frequency, f_c : 6.5GHz
 - Bandwidth, B : 7GHz (i.e. 3-10GHz)
 - Delay resolution, $\Delta\tau$: 142.9ps (i.e. $\Delta\tau=1/B$)
 - No. frequency points, N : 1601
 - Frequency step, Δf : 4.375MHz (i.e. $\Delta f=B/(N-1)$)
 - Max. excess delay, τ_{\max} : 229.6ns (i.e. $\tau_{\max}=1/\Delta f$)
 - Sweeping time, t_{sw} : 800ms
 - Max. Doppler shift, $f_{d,\max}$: 1.25Hz (i.e. $f_{d,\max}=1/t_{\text{sw}}$)

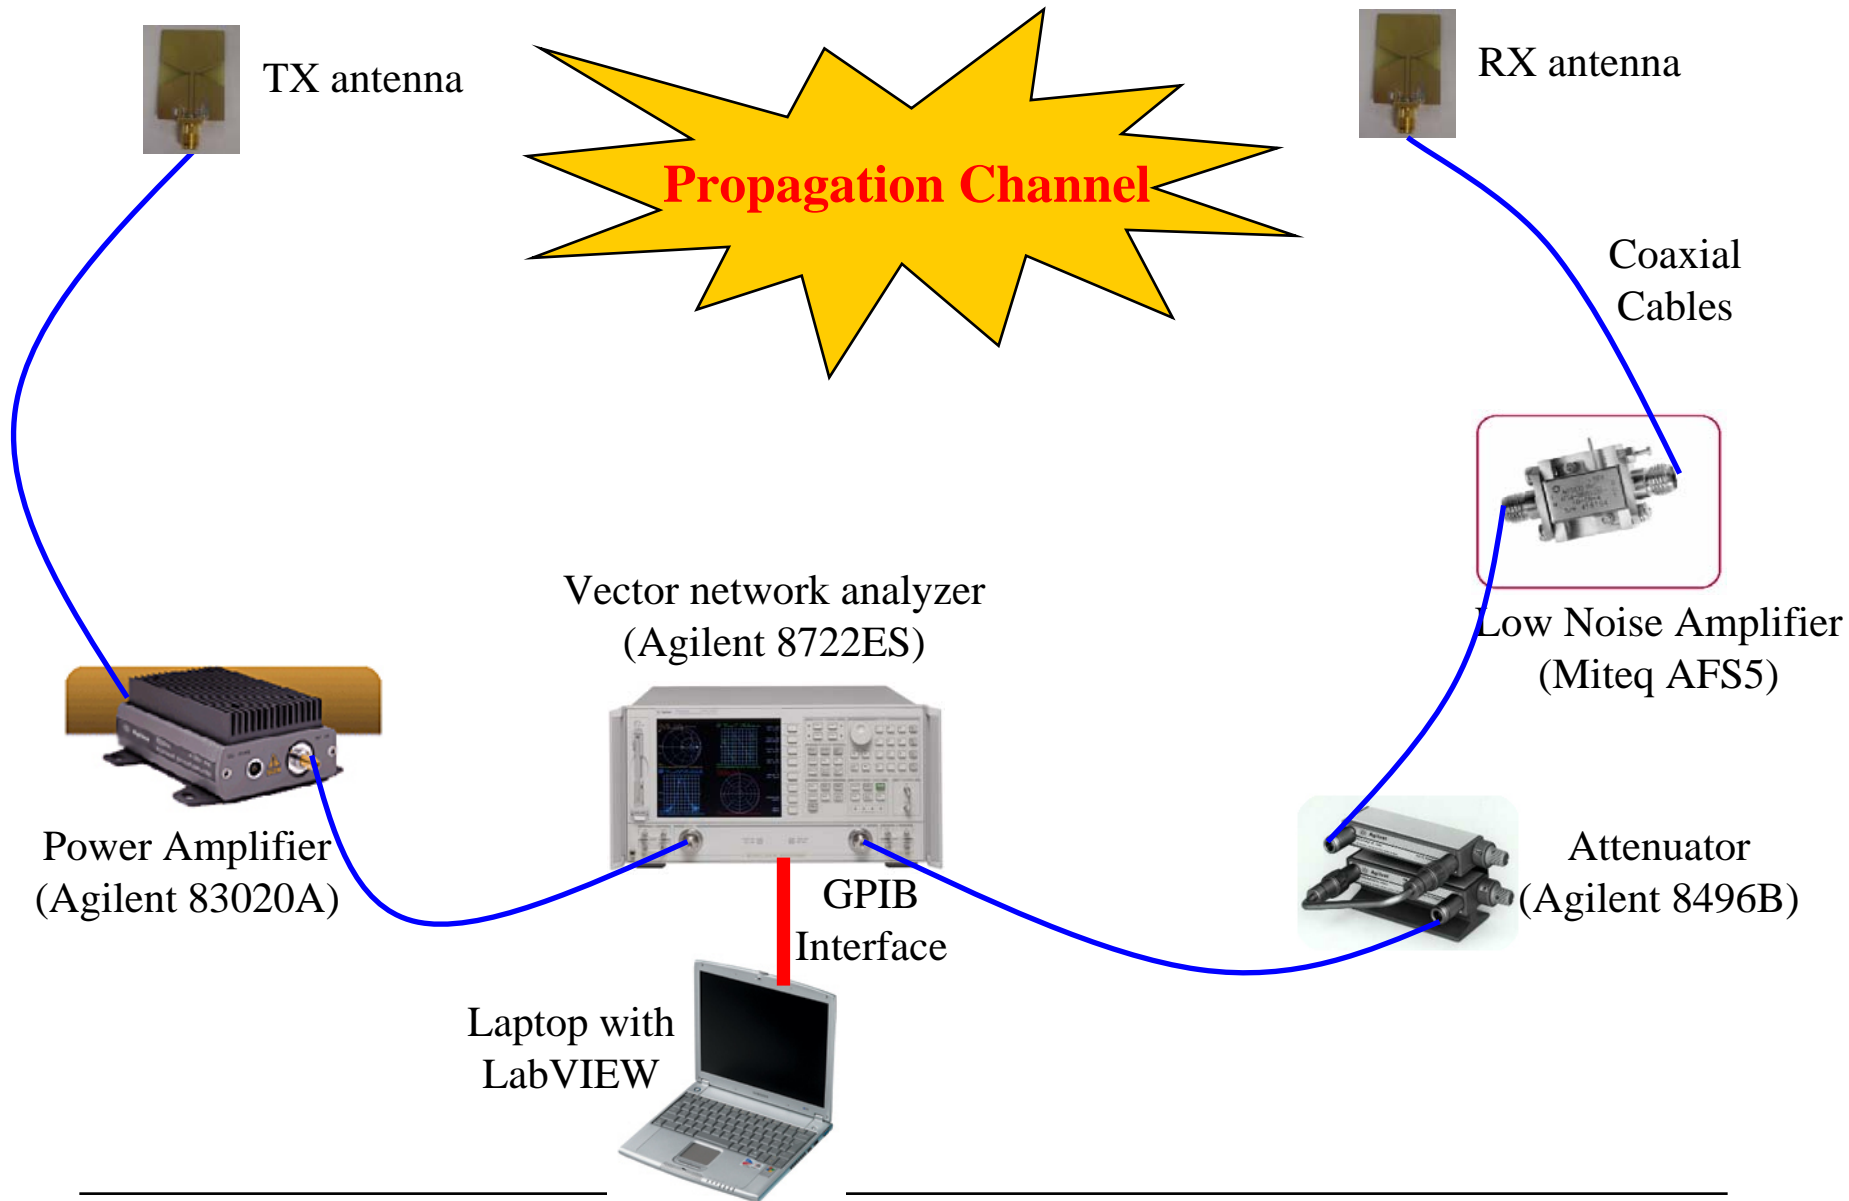

Measurement Setup (2)

- UWB wideband planar dipole antennas
- Measurement controlled by laptop with LabVIEW via GPIB interface
- Calibration performed in an anechoic chamber with 1m reference separation
- Static environment during recording
- Both large-scale & small-scale measurements
 - Large-scale: different RX positions → “local point”
 - Small-scale: 25 (5x5) grid-measurements around each local point → “spatial point”
 - At each spatial point, 30 time-snapshots of the channel complex frequency responses are recorded

Measurement Setup (3)

September 2004

doc.: IEEE 15-04-0452-00-004a

UWB Planar Dipole Antenna

September 2004

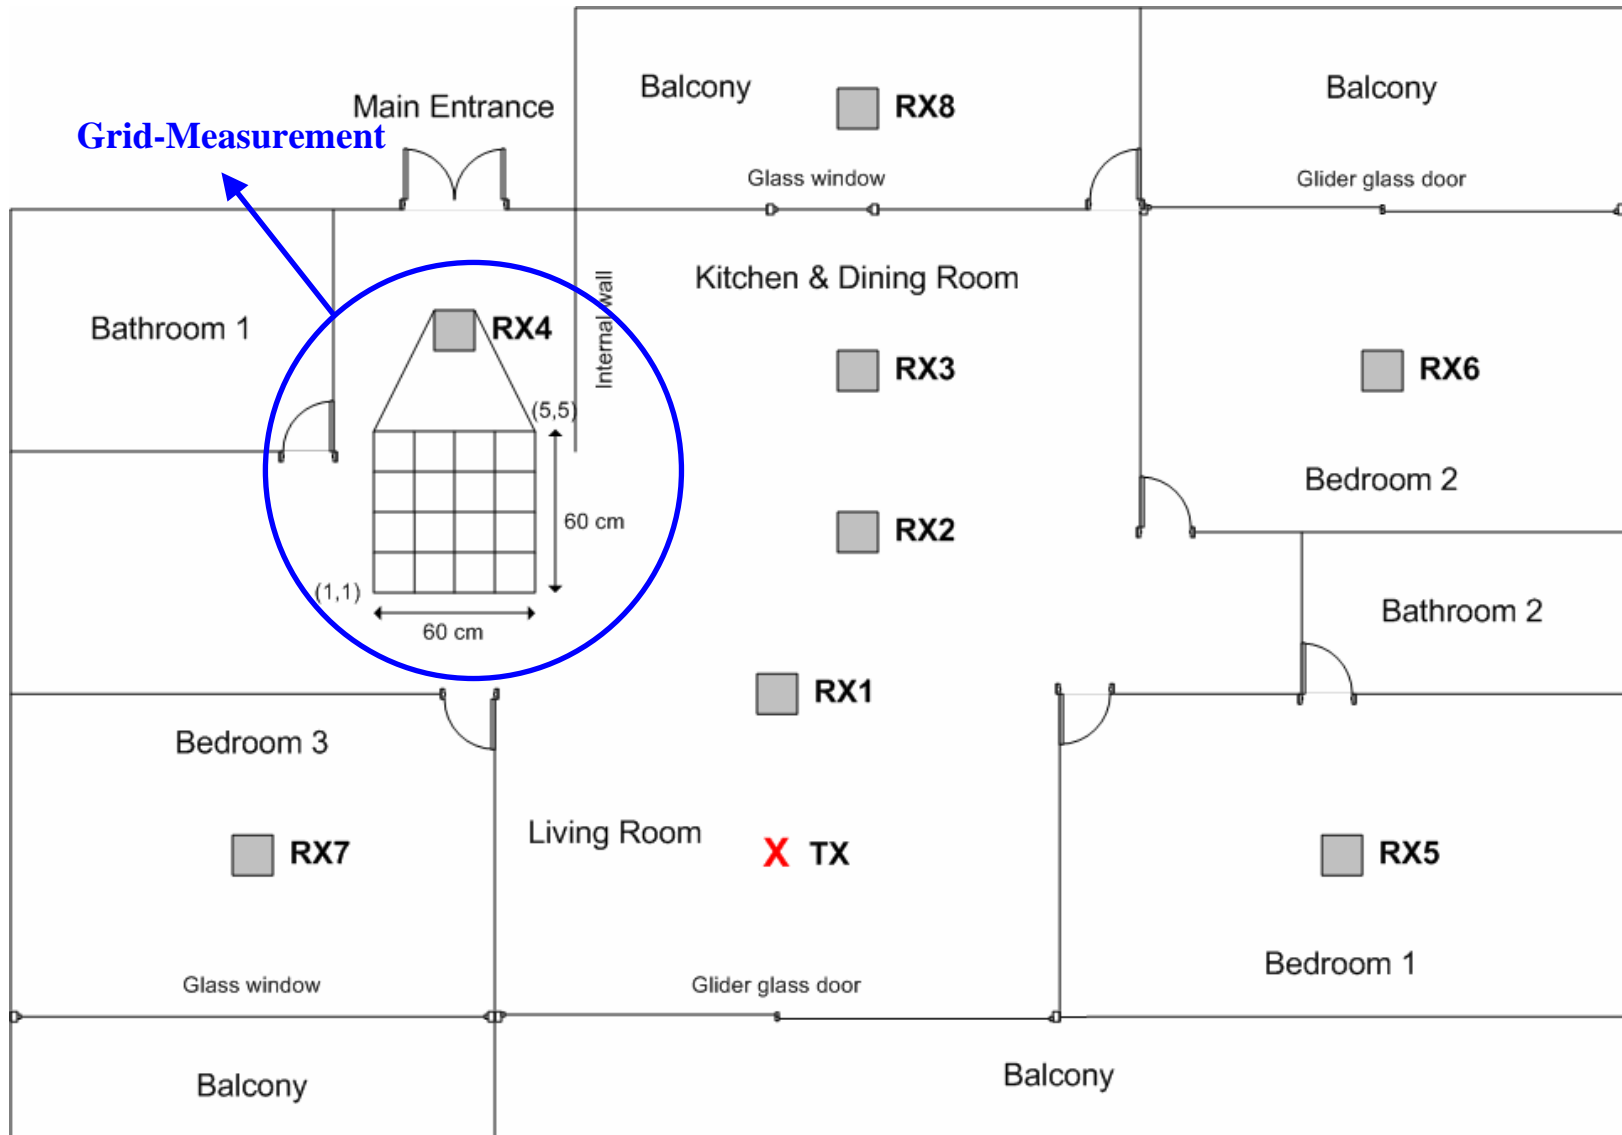

doc.: IEEE 15-04-0452-00-004a

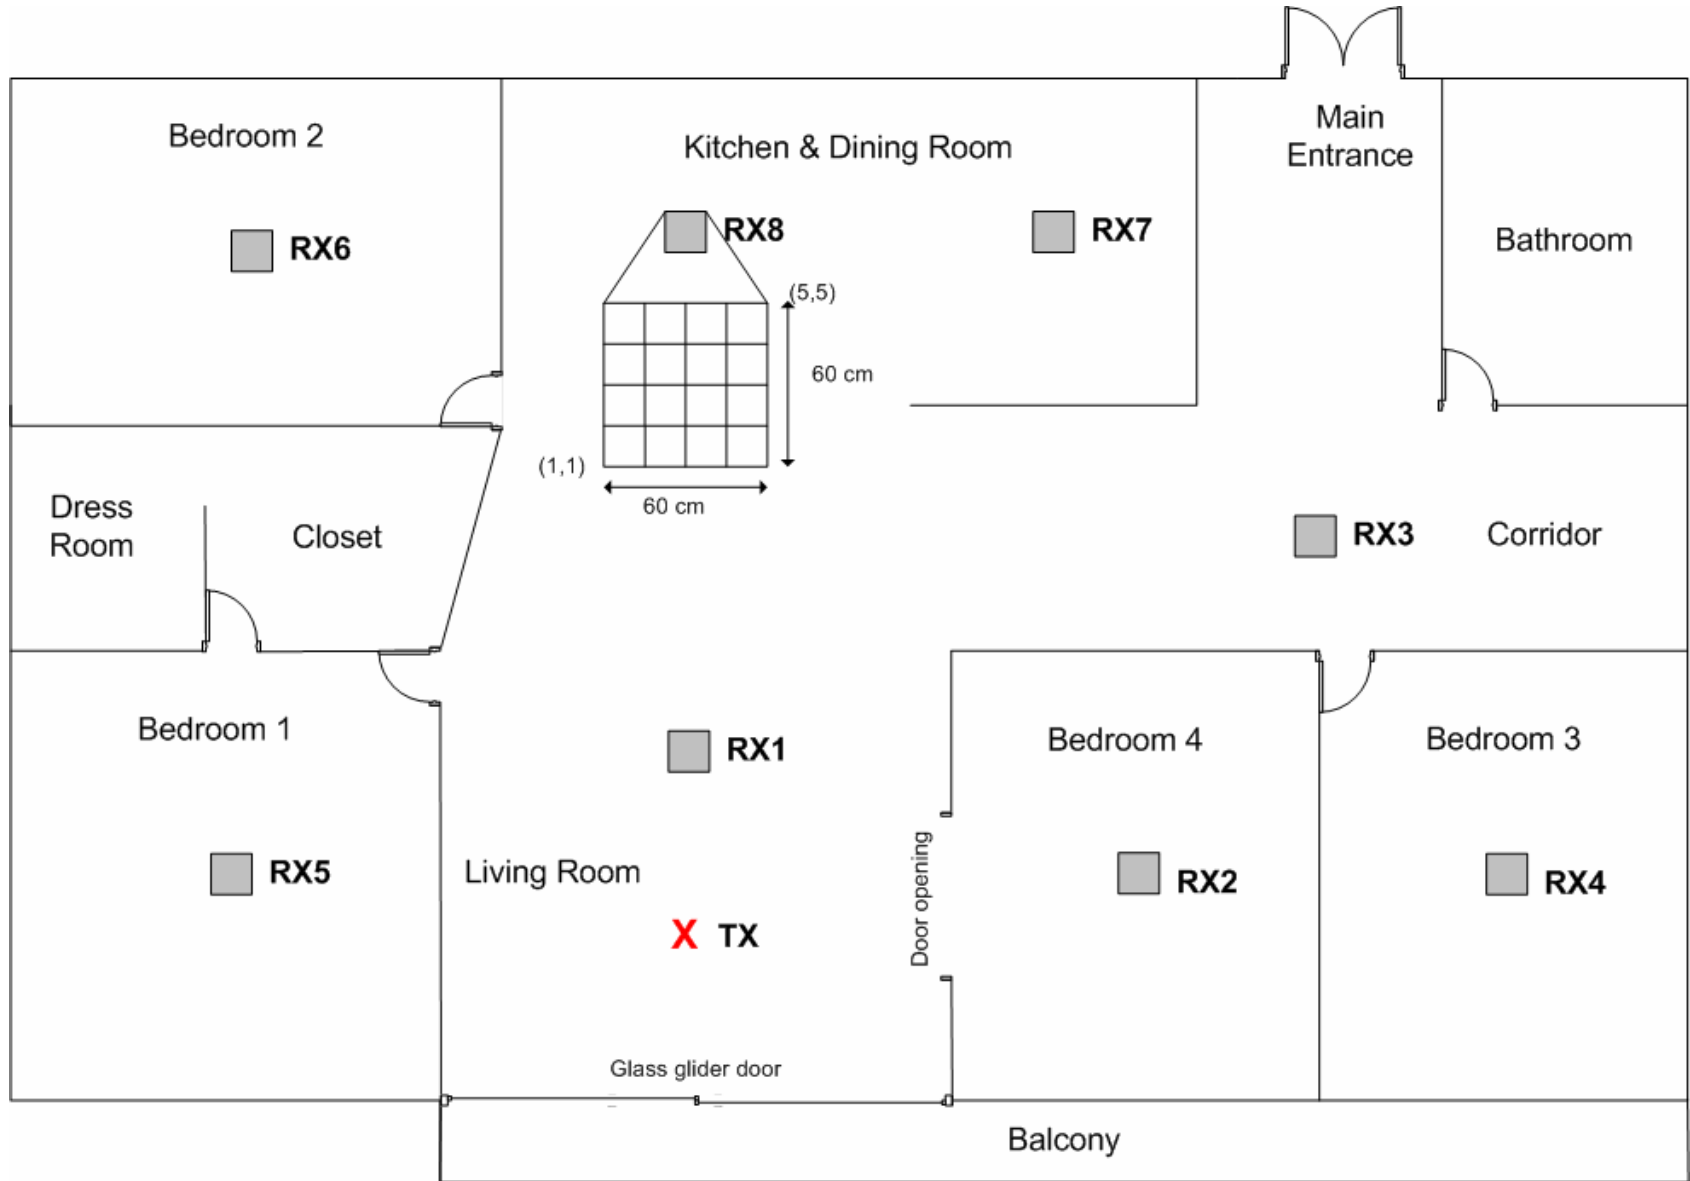

Measurement Environment

- Measurements in various types of high-rise apartments based on several cities in Korea → typical types in Asia countries like Korea, Japan, Singapore, Hong Kong, etc.
 - 3-bedrooms (Apart1)
 - 4-bedrooms (Apart2)
- Both **LOS** and **NLOS** configurations
- TX-RX antennas:
 - Separations: up to 25m
 - Height: 1.25m (with ceiling height of 2.5m)
 - TX antenna: always fixed in the center of the living room
 - RX antenna: moved around the apartment (i.e. 8-10 locations)
- **12,000 channel complex frequency responses** are collected (i.e. 2 apartments x 8 RX local points x 25 spatial points x 30 time snapshots → $2 \times 8 \times 25 \times 30 = 12,000$)

September 2004 3-Bedroom Apartment doc.: IEEE 15-04-0452-00-004a

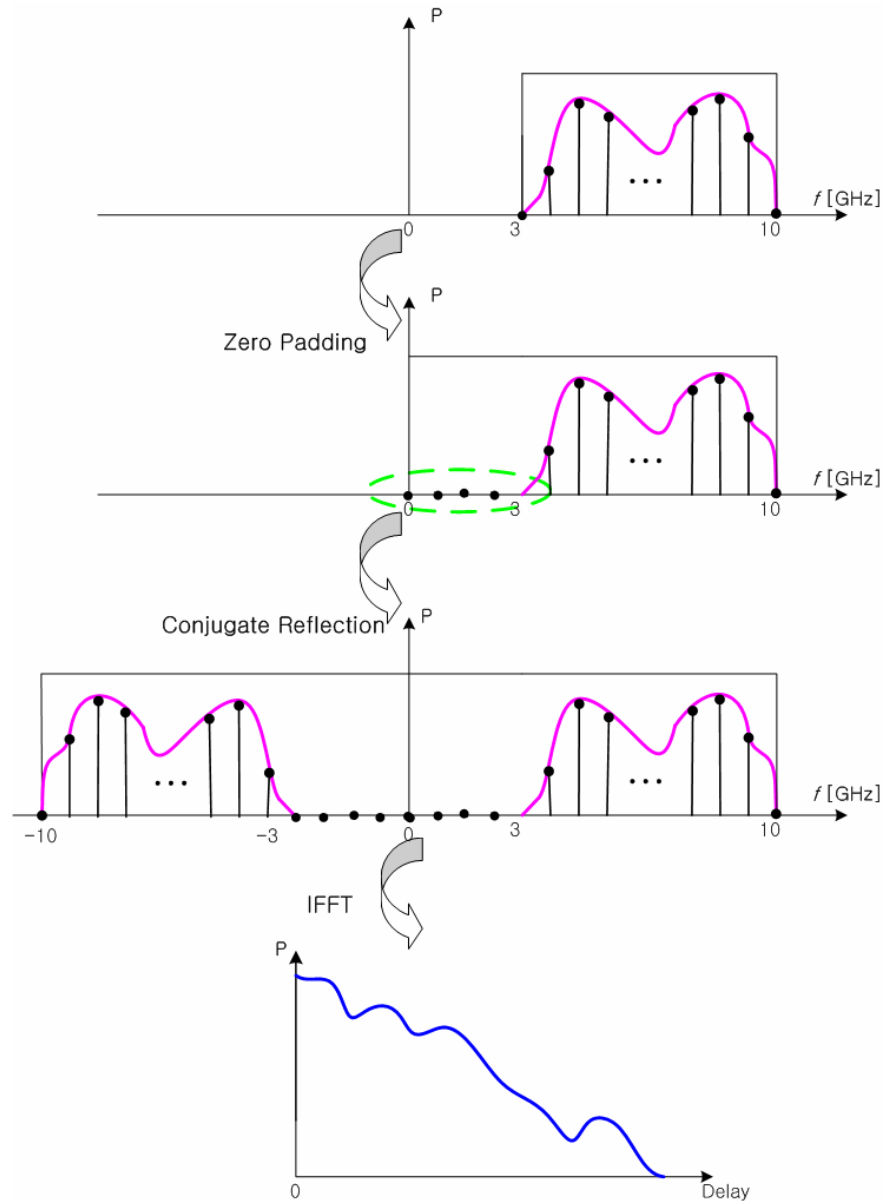

Data Analysis & Post-Processing

- All measurement data are calibrated with the calibration data measured in anechoic chamber to remove effect of measurement system
- Perform frequency domain windowing to reduce the leakage problem
- Complex passband IFFT is deployed to transform the complex frequency response to complex impulse response
- Perform temporal domain binning before extract channel parameters

Complex Passband IFFT

doc.: IEEE 15-04-0452-00-004a

Channel Model Description

- Large-Scale Parameters:
 - Path loss and Shadowing
 - Frequency Decaying Factor
- Small-Scale Parameters:
 - Temporal Domain Parameters
 - S-V Multipath Channel Parameters
 - Small-Scale Amplitude Statistics

Path Loss and Shadowing

- Path loss (PL) vs. Distance (d):

$$PL(d) = PL_0 + 10 \cdot n \cdot \log_{10} \left(\frac{d}{d_0} \right) + S; \quad d \geq d_0$$

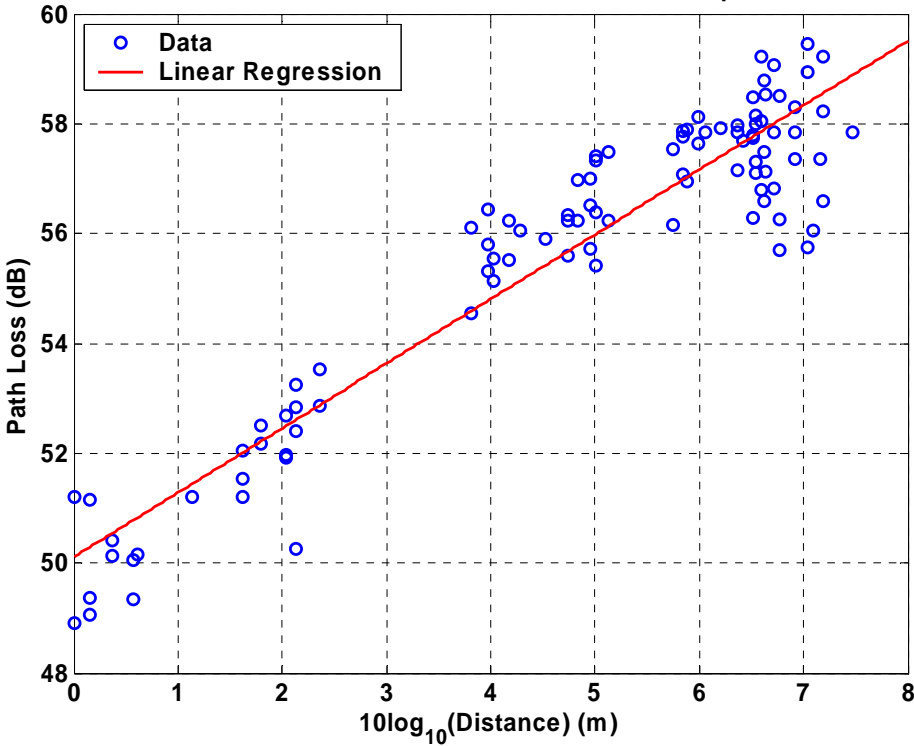

- $d_0 = 1\text{m}$
 - PL_0 : intercept
 - n : path loss exponent
 - S : Shadowing fading parameter
- Perform linear regression to the above equation with measured data to extract the required parameters

Path Loss vs. Distance – LOS

doc.: IEEE 15-04-0452-00-004a

Path Loss under NLOS Scenario in 3-Bedroom Apartment

Path Loss under NLOS Scenario in 4-Bedroom Apartment

Frequency Decaying Factor

- Path loss (PL) vs. Frequency (f):

$$PL(f) \propto \exp(-\delta_1 \cdot f) \quad \text{(Method 1)}$$

or

$$\sqrt{PL(f)} \propto f^{-\delta_2} \quad \text{(Method 2)}$$

Large-Scale Parameters

Scenario/ Environment	n	PL_0	σ_S	δ_1		δ_2	
				μ_{δ_1}	σ_{δ_1}	μ_{δ_2}	σ_{δ_2}
LOS (3-Bedroom Apartment)	1.18	50.1	0.93	0.14	0.01	1.25	0.14
NLOS (3-Bedroom Apartment)	2.18	41.3	1.43	0.08	0.03	1.54	0.39
LOS (4-Bedroom Apartment)	2.48	46.5	1.50	0.08	0.09	0.98	0.09
NLOS (4-Bedroom Apartment)	2.69	47.3	4.69	0.10	0.02	1.51	0.25

Temporal Domain Parameters

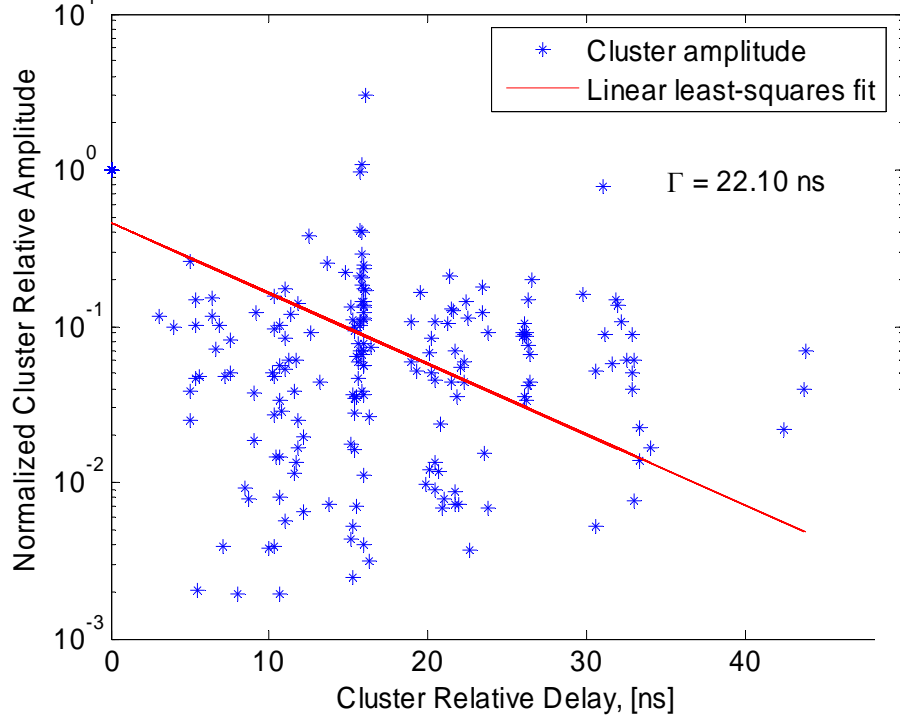

- These parameters were obtained after taking frequency domain **Hamming windowing, passband IFFT & temporal domain binning**

Location	τ_m		τ_{rms}		$NP10dB$		$NP20dB$		$NP30dB$	
	μ_{τ_m}	σ_{τ_m}	$\mu_{\tau_{rms}}$	$\sigma_{\tau_{rms}}$	μ_{NP10dB}	σ_{NP10dB}	μ_{NP20dB}	σ_{NP20dB}	μ_{NP30dB}	σ_{NP30dB}
LOS (3-Bedroom Apartment)	5.88	1.25	14.00	1.53	4.04	1.53	29.91	11.15	145.38	38.89
NLOS (3-Bedroom Apartment)	36.09	15.48	38.61	8.03	19.58	7.64	141.63	42.23	512.57	76.28
LOS (4-Bedroom Apartment)	5.01	0.64	12.48	1.87	5.97	1.96	37.21	9.20	161.02	31.59
NLOS (4-Bedroom Apartment)	24.95	8.47	26.51	5.22	23.51	10.75	139.95	50.14	424.78	93.77

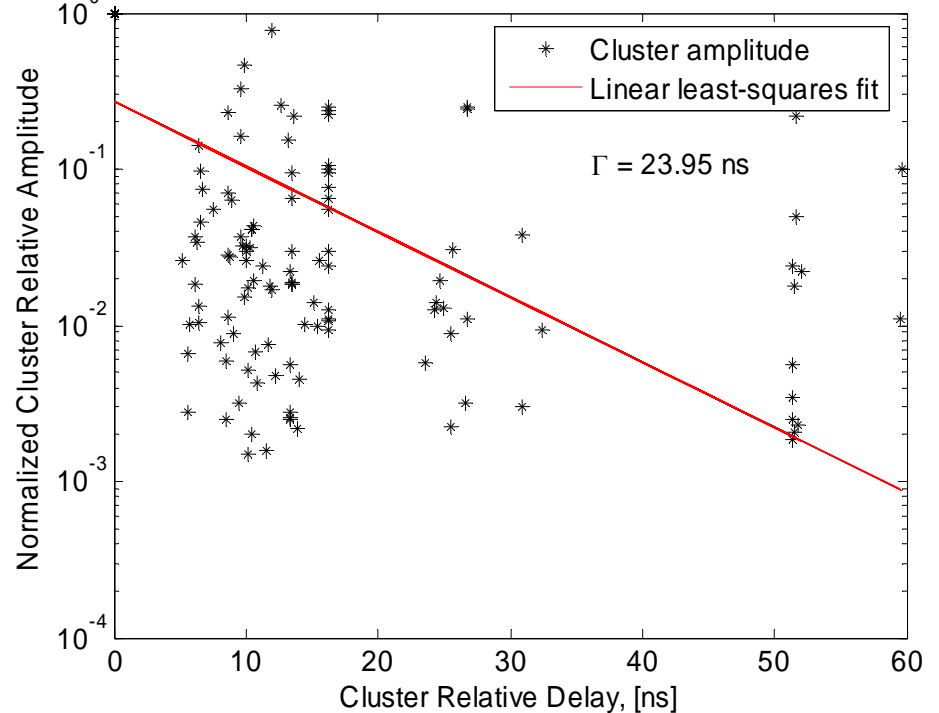

S-V Multipath Channel Parameters

- Saleh-Valenzuela model described by the following parameters:
 - Γ : cluster decay factor
 - γ : ray decay factor
 - Λ : mean cluster arrival rate
 - λ : mean ray arrival rate
 - σ_a : standard deviation of lognormal distributed path powers (dB)
 - L_{mean} : Mean number of clusters
 - μ_{KI} : Mean of the exponential distributed number of MPCs per cluster

Normalized Cluster Relative Power vs. Cluster Relative Delay (Apart1-LOS)

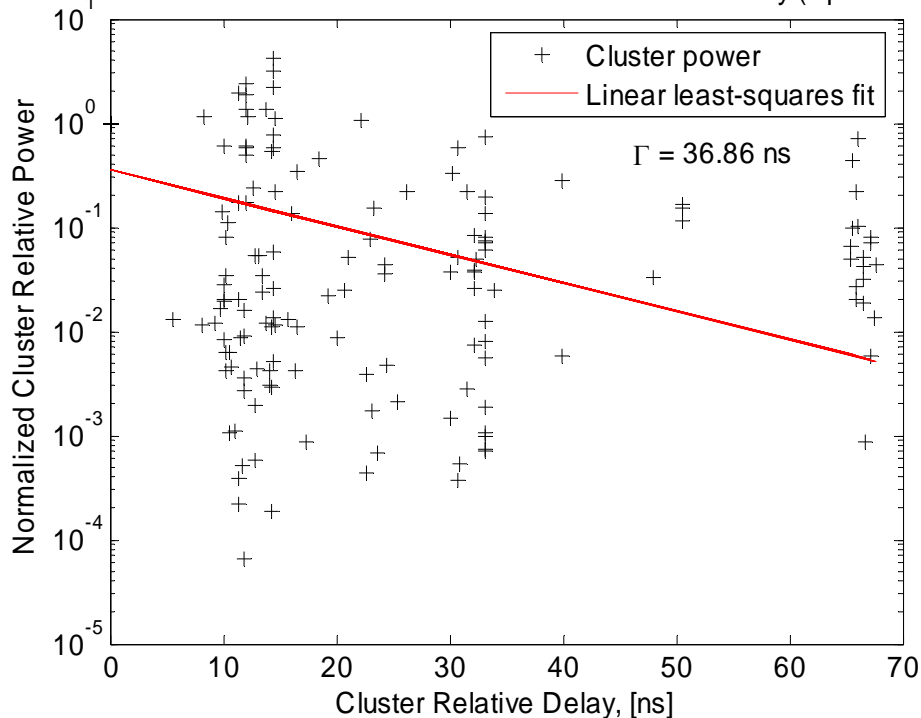

Normalized Cluster Relative Power vs. Cluster Relative Delay (Apart2-LOS)

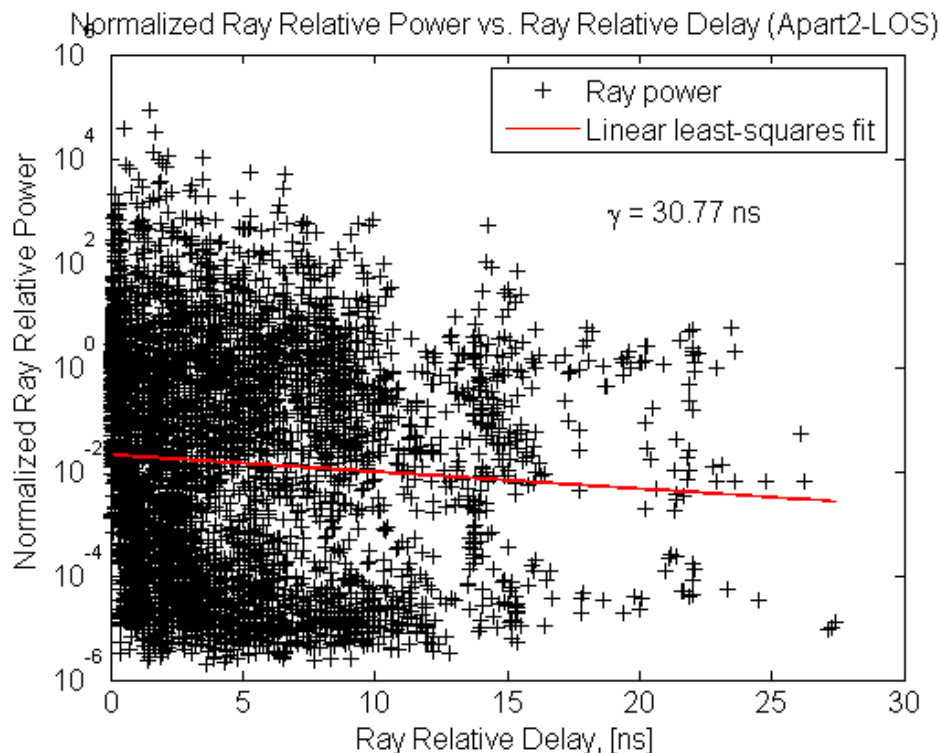

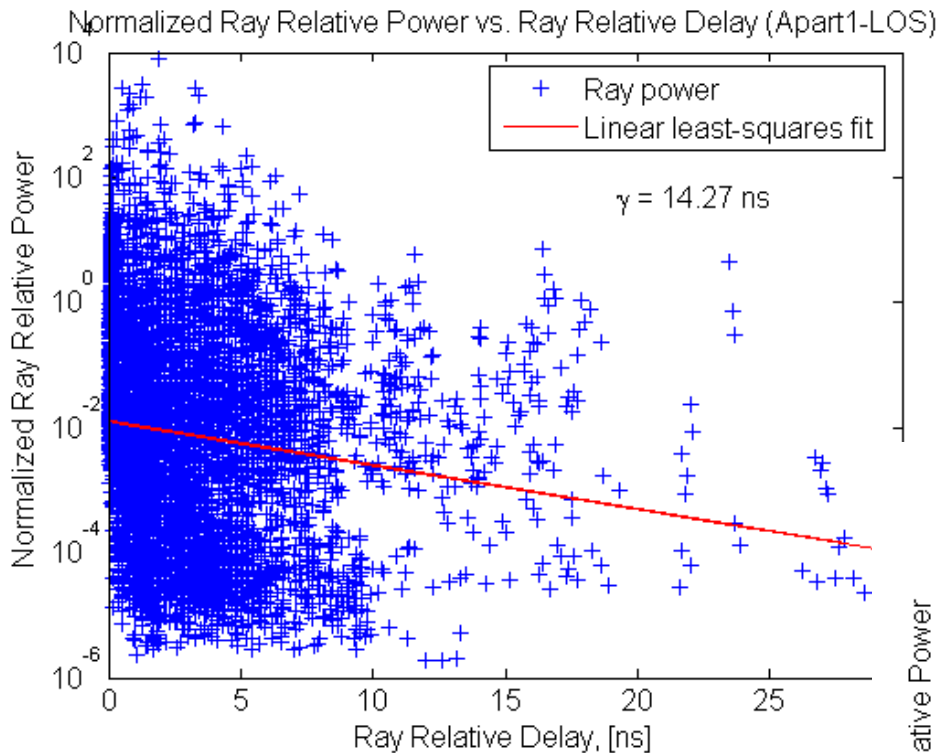

Normalized Cluster Relative Power vs. Cluster Relative Delay (Apart1-NLOS)

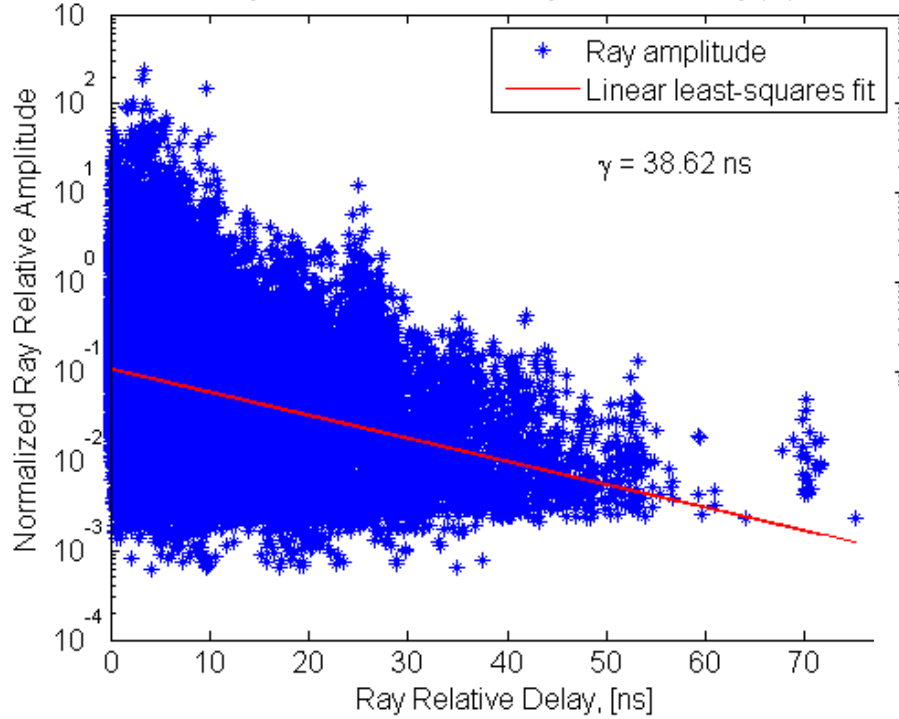

Normalized Cluster Relative Power vs. Cluster Relative Delay (Apart2-NLOS)

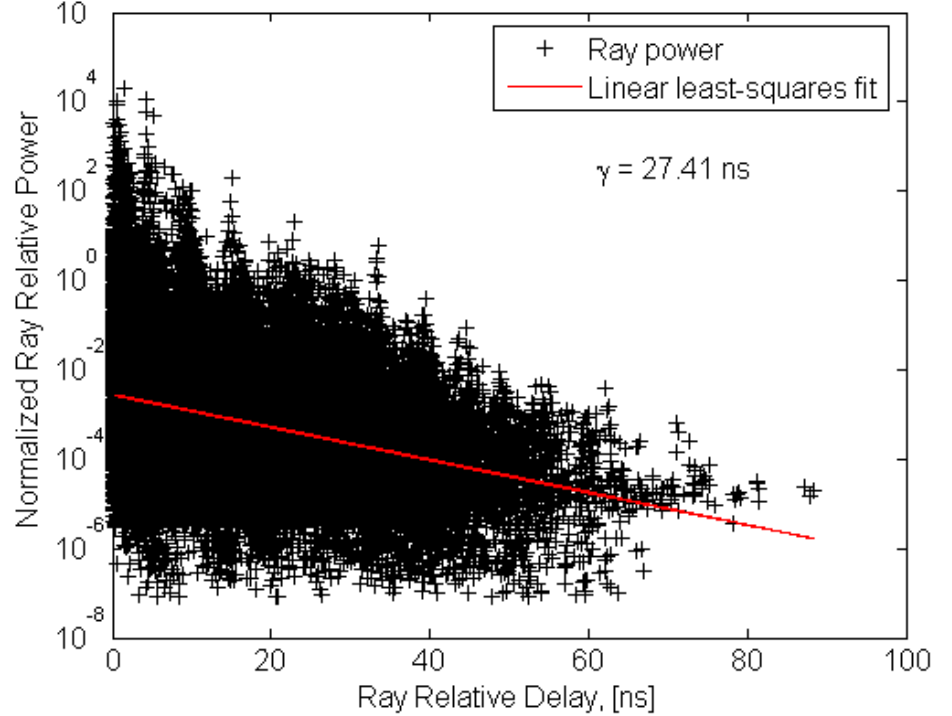

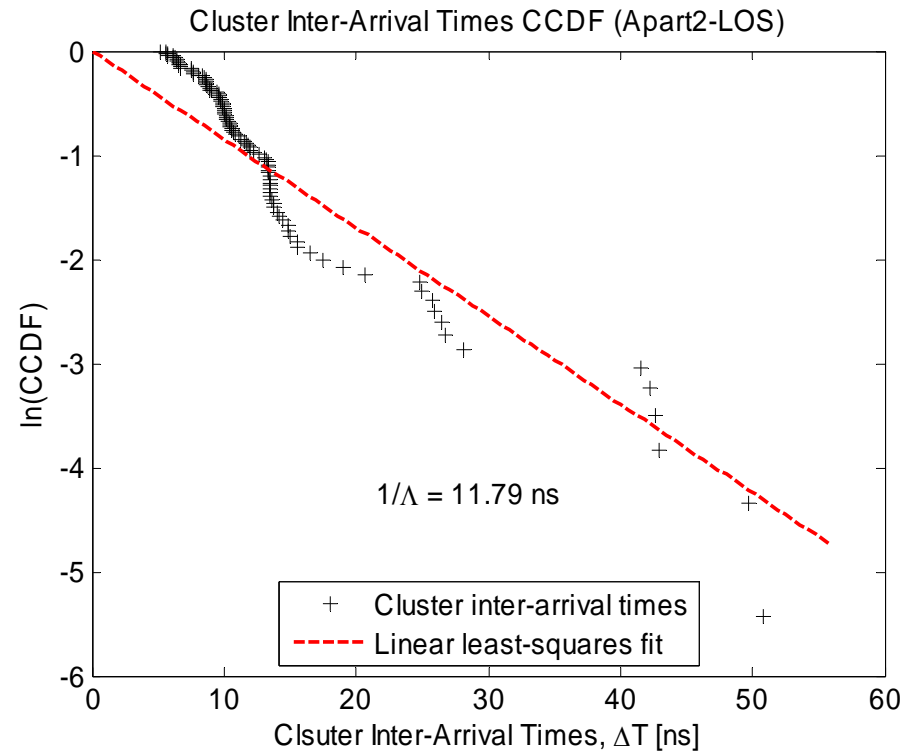

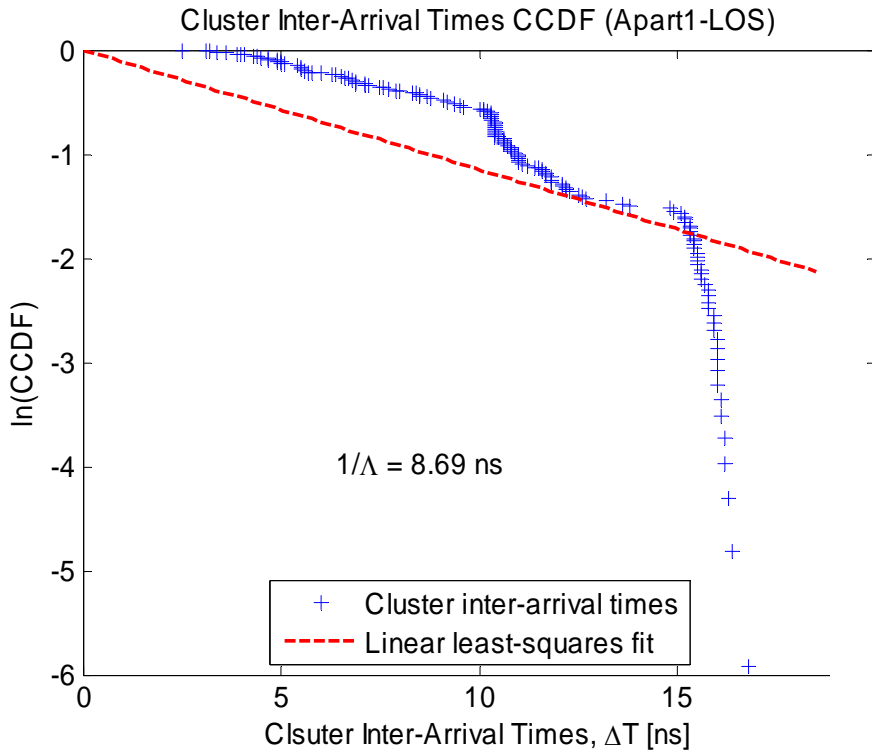

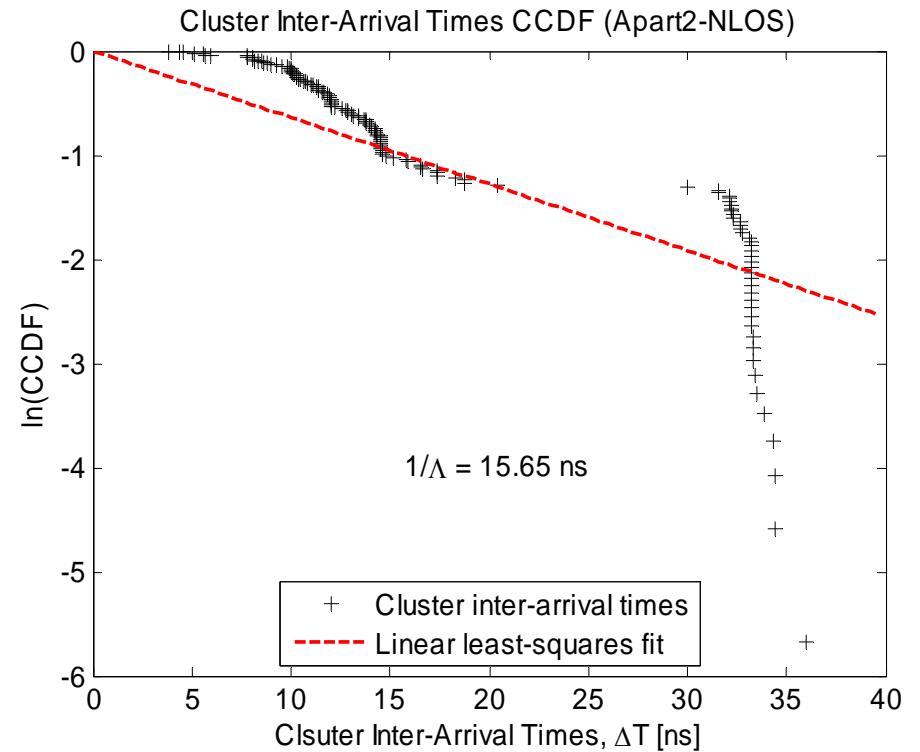

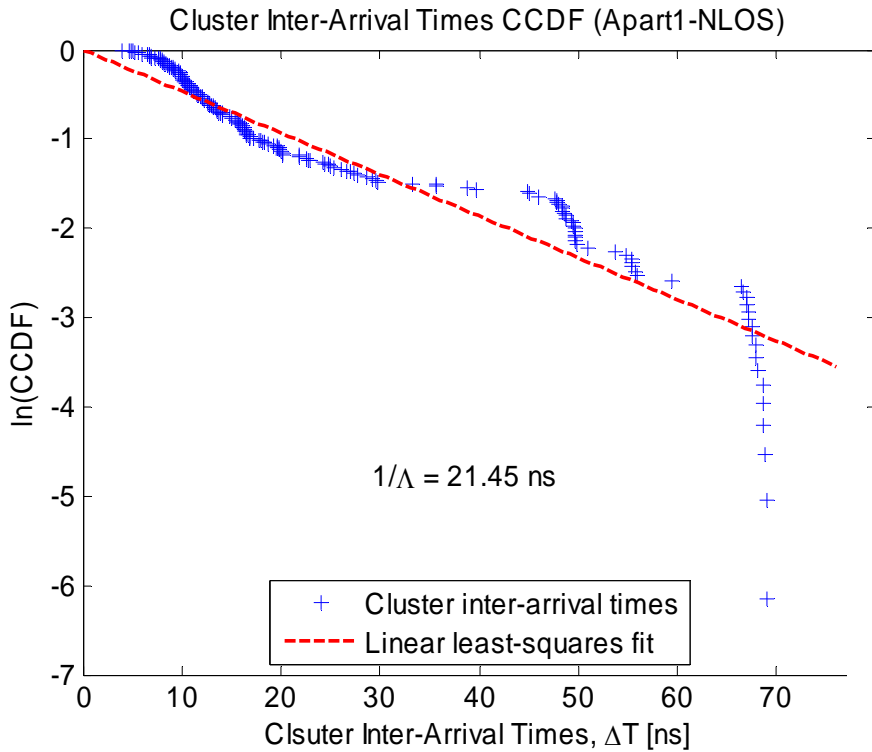

Normalized Ray Relative Power vs. Ray Relative Delay (Apart1-NLOS)

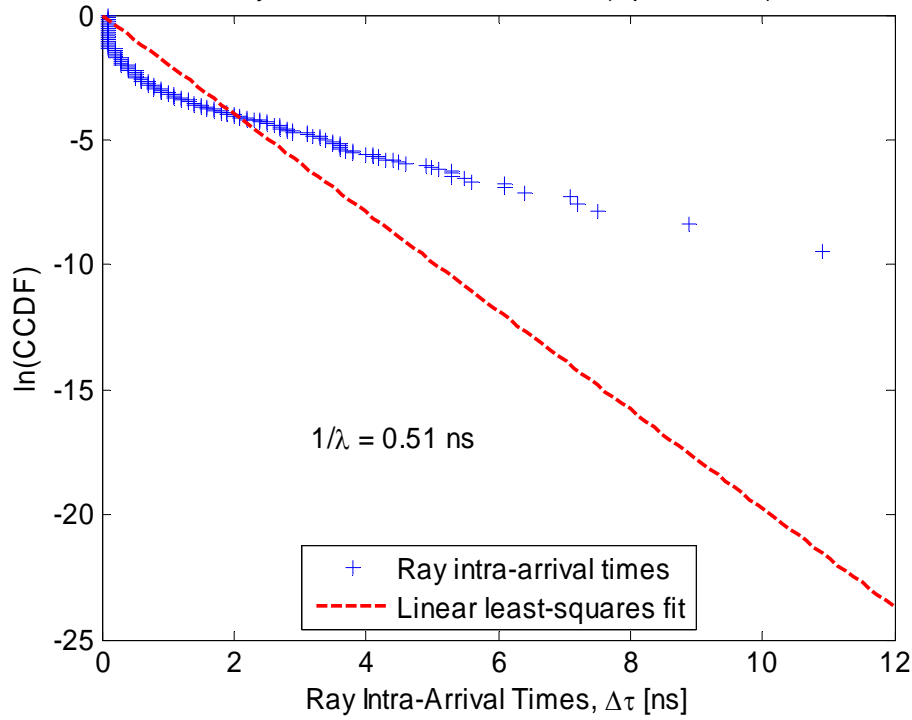

Normalized Ray Relative Power vs. Ray Relative Delay (Apart2-NLOS)

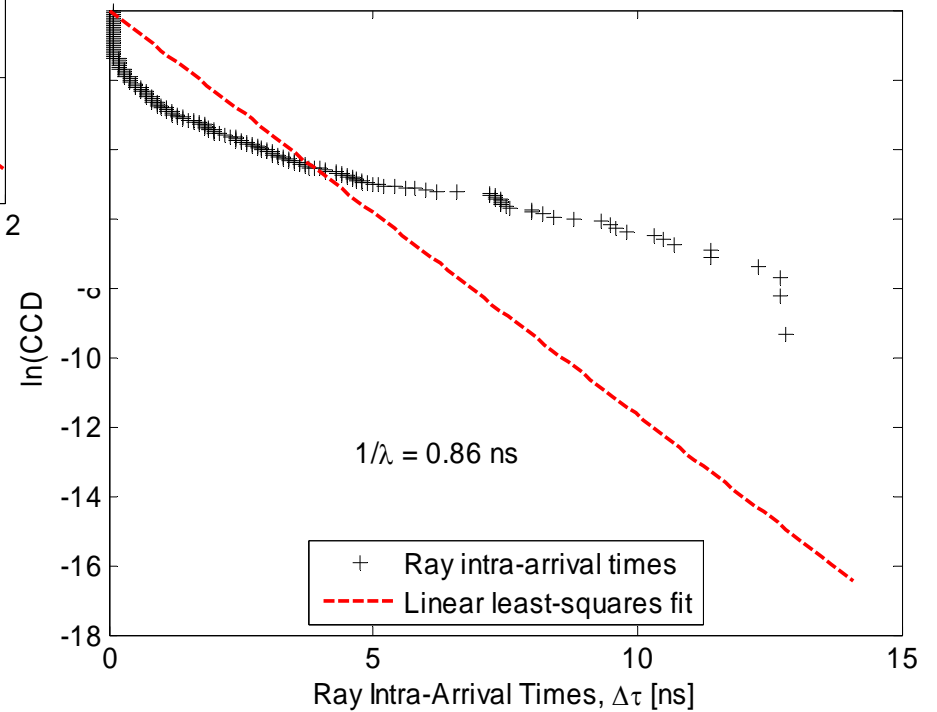

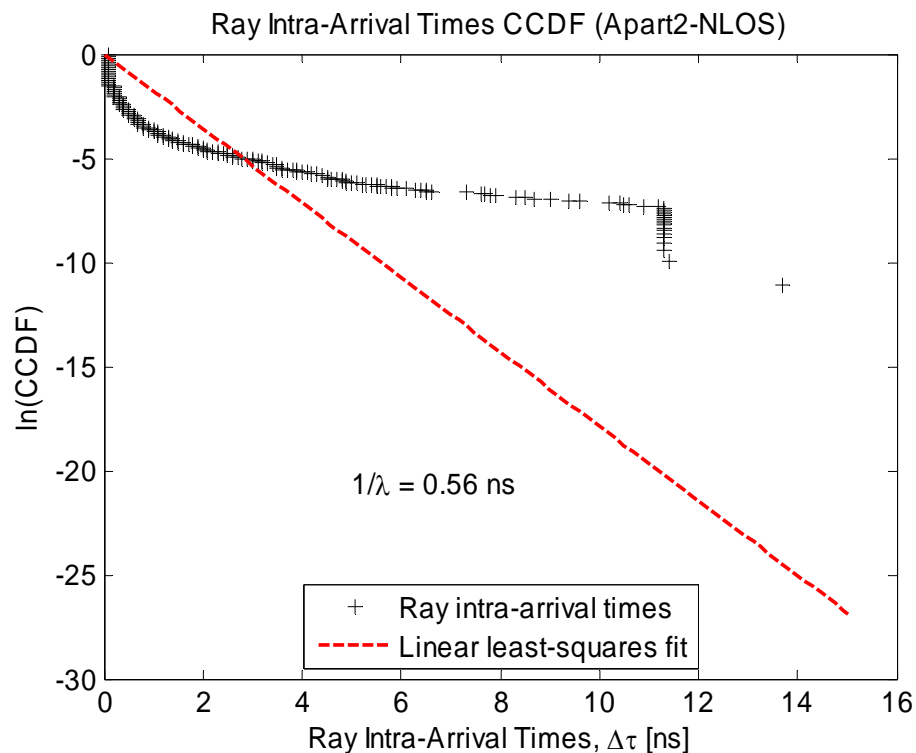

Ray Intra-Arrival Times CCDF (Apart1-LOS)

Ray Intra-Arrival Times CCDF (Apart2-LOS)

Mixture Poisson Distribution

- Fitting the ray arrival times to a mixture of 2 Poisson distributions similar to [1]:

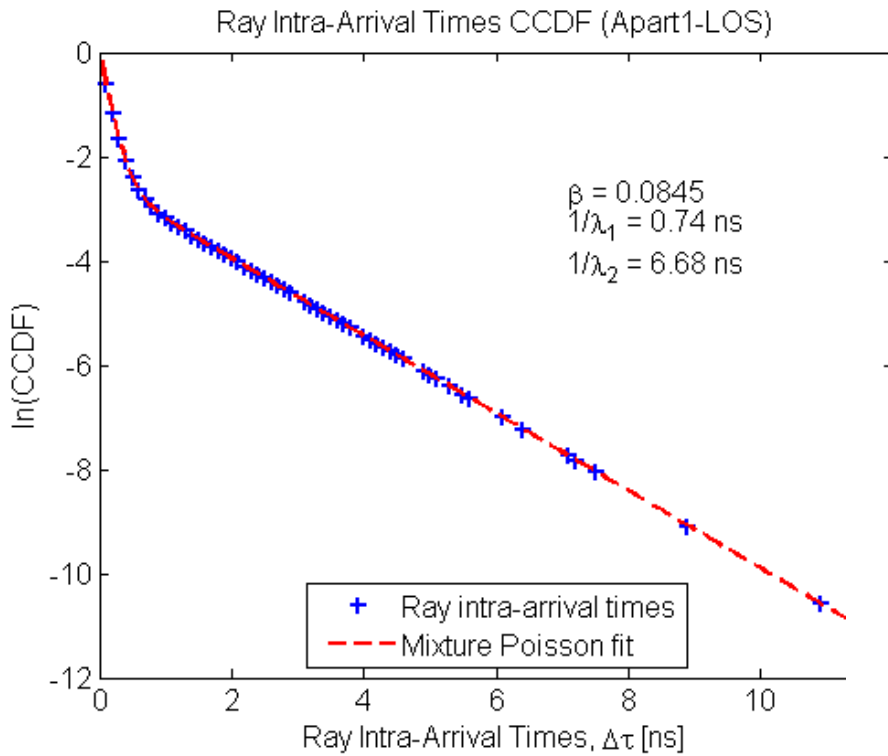

$$p\left(\tau_{k,l} \mid \tau_{(k-1),l}\right) = \beta\lambda_1 \exp\left[-\lambda_1\left(\tau_{k,l} - \tau_{(k-1),l}\right)\right] \\ + (\beta - 1)\lambda_2 \exp\left[-\lambda_2\left(\tau_{k,l} - \tau_{(k-1),l}\right)\right]$$

- β : mixture probability
- λ_1 & λ_2 : ray arrival rates

Mixture Poisson Distributions – LOS

S-V Multipath Channel Parameters

Parameters	Apart1- LOS	Apart1- NLOS	Apart2- LOS	Apart2- NLOS
\bar{L}	3	4	3	3
μ_{K_i}	24.10	87.19	30.47	117.36
Γ [ns]	22.10	51.47	23.95	36.86
γ [ns]	14.27	38.62	30.77	27.40
$1/\Lambda$ [ns]	8.69	21.45	11.79	15.65
$1/\lambda$ [ns]	0.51	0.72	0.86	0.56
σ_a [dB]	0.87	0.94	0.85	0.89
β	0.08	0.05	0.11	0.04
$1/\lambda_1$ [ns]	0.74	0.54	0.56	0.59
$1/\lambda_2$ [ns]	6.68	6.78	6.98	6.97

Small-Scale Amplitude Statistics

- Comparison of empirical **path amplitude** distribution with the following four commonly used theoretical distributions:
 - Lognormal
 - Nakagami
 - Rayleigh
 - Ricean
 - Weibull
- The goodness-of-fit of the received signal amplitudes is evaluated using Kolmogorov-Smirnov (K-S) test & Chi-Square (χ^2) test with 5% and 10% significance level, respectively.

Goodness-of-Test: LOS

Apart1-LOS

Distributions	K-S Test		χ^2 Test	
	5%	10%	5%	10%
Lognormal	97.67	91.33	70.04	54.65
Nakagami	94.84	92.31	86.50	77.00
Rayleigh	61.73	51.92	60.69	49.23
Ricean	52.65	44.94	46.31	33.50
Weibull	99.79	99.15	89.75	80.71

Apart2-LOS

Distributions	K-S Test		χ^2 Test	
	5%	10%	5%	10%
Lognormal	97.35	92.74	70.86	54.64
Nakagami	94.86	92.54	87.78	79.18
Rayleigh	62.86	52.13	61.31	49.82
Ricean	40.61	33.14	35.69	26.24
Weibull	99.13	97.82	88.78	79.38

Goodness-of-Test: NLOS

Apart1-NLOS

Distributions	K-S Test		χ^2 Test	
	5%	10%	5%	10%
Lognormal	92.50	83.54	55.28	41.39
Nakagami	90.07	85.77	65.43	54.37
Rayleigh	46.98	37.61	46.15	34.68
Ricean	42.46	34.15	35.21	24.89
Weibull	91.54	86.19	67.56	55.81

Apart2-NLOS

Distributions	K-S Test		χ^2 Test	
	5%	10%	5%	10%
Lognormal	91.27	84.15	57.61	44.20
Nakagami	92.41	88.22	76.24	65.86
Rayleigh	45.53	36.12	46.87	36.40
Ricean	39.46	31.18	34.45	29.91
Weibull	88.74	84.23	70.68	60.41

Small-Scale Amplitude Statistics Parameters

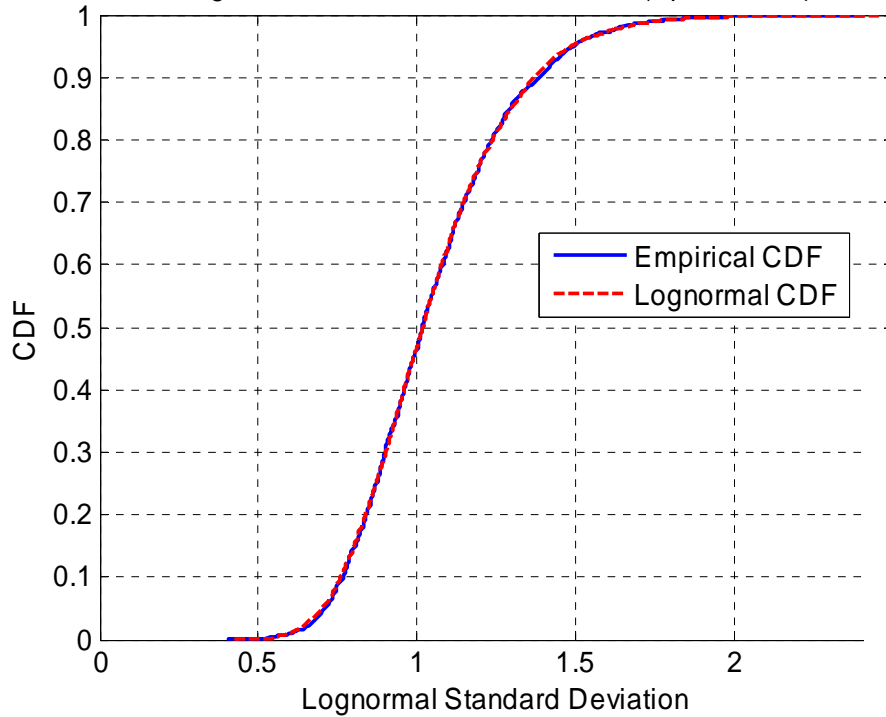

- The results demonstrate that lognormal, Nakagami and Weibull fit the measurement data well.
- Parameters of these distributions (i.e. standard deviation of lognormal PDF, m-parameter of Nakagami PDF and b-parameter of Weibull PDF) can be modeled by a lognormal distribution
- These parameters are almost constant across the excess delay

Small-Scale Amplitude Statistics Parameters

Location	σ -Lognormal Parameter		m -Nakagami Parameter		b -Weibull Parameter	
	μ_{σ_L}	σ_{σ_L}	μ_{m_N}	σ_{m_N}	μ_{b_W}	σ_{b_W}
LOS (3-Bedroom Apart.)	0.022	0.23	0.68	0.28	0.24	0.19
NLOS (3-Bedroom Apart.)	0.036	0.27	0.68	0.35	0.24	0.23
LOS (4-Bedroom Apart.)	0.021	0.25	0.66	0.28	0.25	0.19
NLOS (4-Bedroom Apart.)	0.049	0.27	0.69	0.28	0.23	0.18

Conclusion

- Frequency domain technique UWB measurement campaign has been carried out in indoor residential environment (high-rise apartments) covering frequencies from 3-10 GHz.
- Measurement covered both LOS & NLOS scenarios.
- Channel measurement results which characterize both the large-scale and small-scale parameters of the channel are reported.
