| Re: | IEEE C802.16j-06/248r1 |
| Abstract | Introducing R-LINK source  and Link direction TLV for MMR link status monitoring and reporting |
| Purpose | To make MMR-BS collectively acquire the current status of all relay links in MMR network |
| Notice | This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein. |
| Release | The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16. |
| Patent Policy and Procedures | The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures <http://ieee802.org/16/ipr/patents/policy.html>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <mailto:chair@wirelessman.org> as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site <http://ieee802.org/16/ipr/patents/notices>. |

# R-link TLV for MMR relay link monitoring and reporting procedure

## 1 Introduction

In 802.16-2005, it defined that when BS requires RSSI and CINR channel measurement reports, it shall sends REP-REQ message to MS. The REP-REQ message should be sent by MS to response to channel measurement listed in the received REP-REQ. Where regulation mandates detection of specific signals by the SS, the SS shall also send a REP-RSP in an unsolicited fashion upon detecting such signals on the channels it is operating in. Within MMR network, a RS not only needs to monitor the downlink (R-DL) situation from its parent nodes, but also needs to monitor the uplink (R-UL) conditions from its children node. RS shall report the measured channel conditions (both R-DL and R-UL) to MMR BS via either polling way (REP-REQ/RSP) or unsolicited way (REP-RSP). This contribution proposes Link-source and Link-direction TLV where Link-source indicates which link has being measured, and Link-direction to indicate whether the measured link is a R-DL or R-UL. This TLV will be added into REP-RSP such that MMR BS can associate the measured results with the given links. With the collectively acquired link status, MMR BS would effectively schedule the radio resource, select the optimized path for the relay, and route the traffic to an alternative path when a failure case occurred.

## Text Proposal

### *[Insert the following new section]*

### 11.xx Link-source and Link-direction TLV format

Link-source and Link-direction is defined as one-byte TLV. Link-source is the source end of the measured link, which is represented by IDcell code of the source node. In 802.16-2005, ID cell is defined as 5-bit integer. Here Link-direction is defined as 2-bit size.

| Name | Type | Length | Value |
|---|---|---|---|
| **R-Link** | **xxx** | **1 byte** | **8-bit Integer** |

| Syntax | Size | Notes |
|---|---|---|
| **R-link {** | | |
| **Direction** | **2 bits** | **0b00 = Reserved**<br>**0b01 = Uplink**<br>**0b10 = Downlink**<br>**0b11 = Reserved** |
| **Reserved** | **1 bit** | |
| **Source** | **5 bits** | **IDcell code of the source end** |
| **}** | | |
