Cooperative relaying system

Amir Rubin

Intel Corporation

Cooperative relaying accelerates 802.16 networks

- Communication performance breakthrough
- Longer battery lifetime
- Quick implementation
- Low cost solution

Cooperative relaying characteristics

- Relaying stations forward received physical layer information towards the destination

- Multiple synchronized transmissions from spatially distributed relaying stations on the uplink or downlink

- Known to combat effectively wireless channel conditions

Example: two RS serving a SS with 2-hop relaying

Relay Station RS

Hop #1

Base Station BS

Hop # 1

Hop #2

Legend

Strong signal:
Receive high MCS

Weak signal:
Receive preamble and maps

Relay Station RS

Hop #2

Destination SS
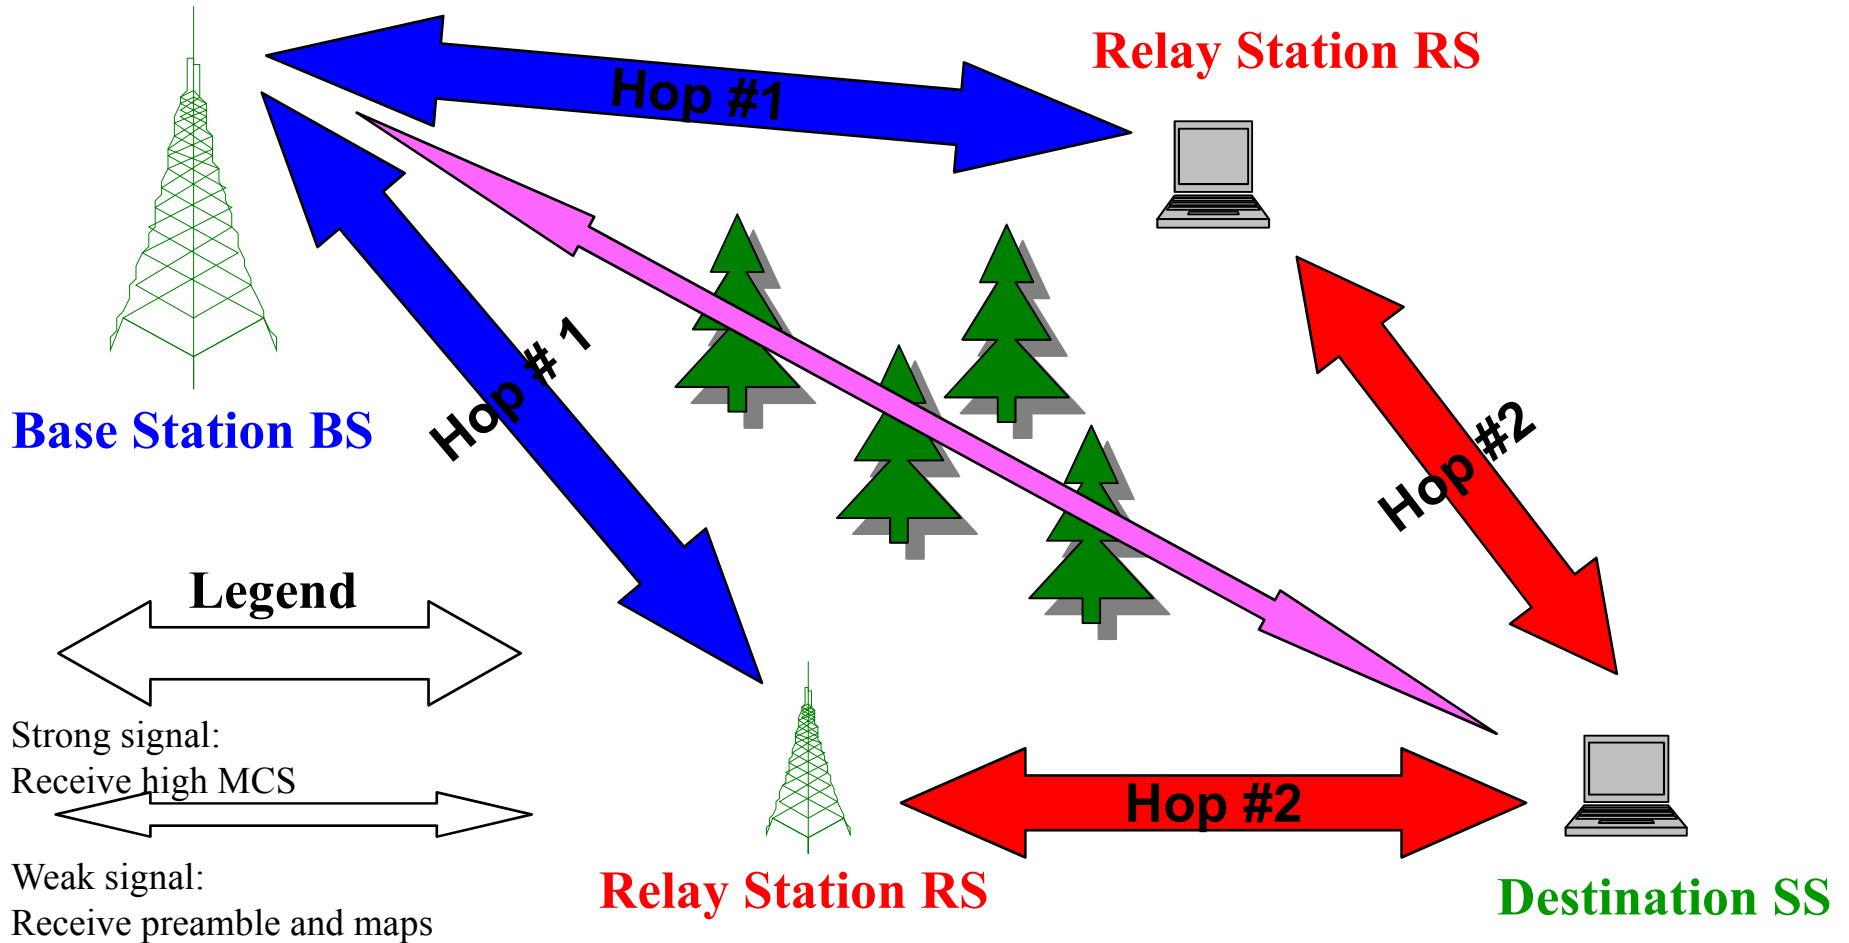

Performance breakthrough illustration

- Infrastructure relay stations in a 3km radius cell
- Deployment of relays is 100m grid at 1 meter above roof tops
- Pedestrian speed indoor: 2.5Ghz model from ITU-R
- Uplink performance is examined

Locations of BS and RS devices
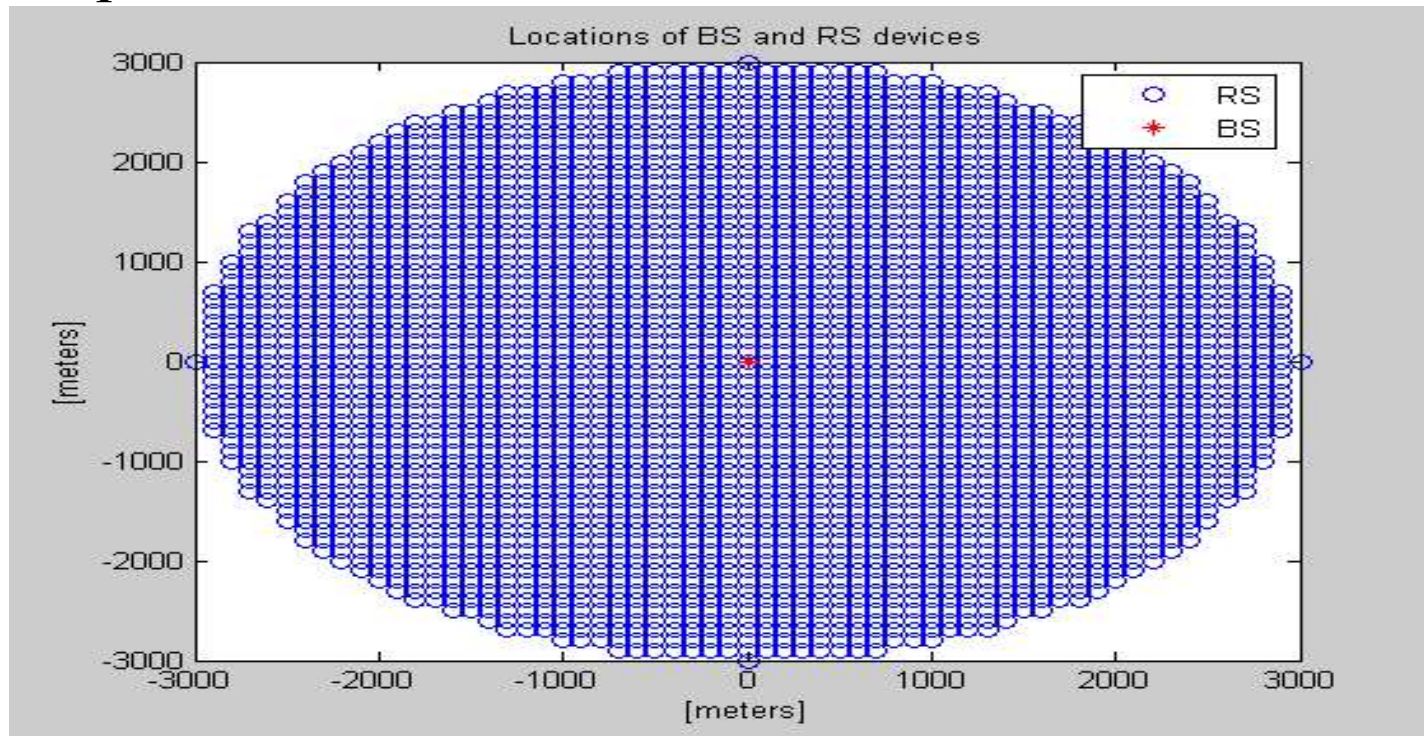

Channel model

- Pedestrian speed indoor model for 2.5 GHz

Transmit power	**20dBm**
Noise power	-174dBm/Hz + 10log10(240e3) + NF = -174+54+6 **= -114dBm**
Shadowing [dB]	~N(0,10)
Building Penetration [dB]	~N(10,8) for BS and 0 for RS
Fast fading taps [dB]	ChanA:[0, -9.7, -19.2, -22.8 -100 -100] ChanB:[0 -0.9 -4.9 -8.0, -7.8 -23.9]
Path loss [dB]	40*(1-4e-3*h)*log10(R) - 18*log10(h) + 80 + 21*log10(f)

h = Height above roof top of BS and of RS in meters, BS=15 and RS=1

f = carrier frequency (MHz), 2500 used

R = distance between BS and mobile (km)

Performance : increase in spectral efficiency

•Performance metric: Shannon capacity at 20% outage
•Two-hop relaying with same rate supported on both hops
•Compare direct rate and relayed rate [b/s/Hz] vs. BS distance [m]

2.5Ghz cell: cooperative relaying and SISO uplink: Shanon allowed equivalent (bits/sec)/hz in 80% of received SNR cases vs. distance from BS

Spectral efficiency [b/s/Hz]

with 20% outage

o SISO
* Cooperative relaying
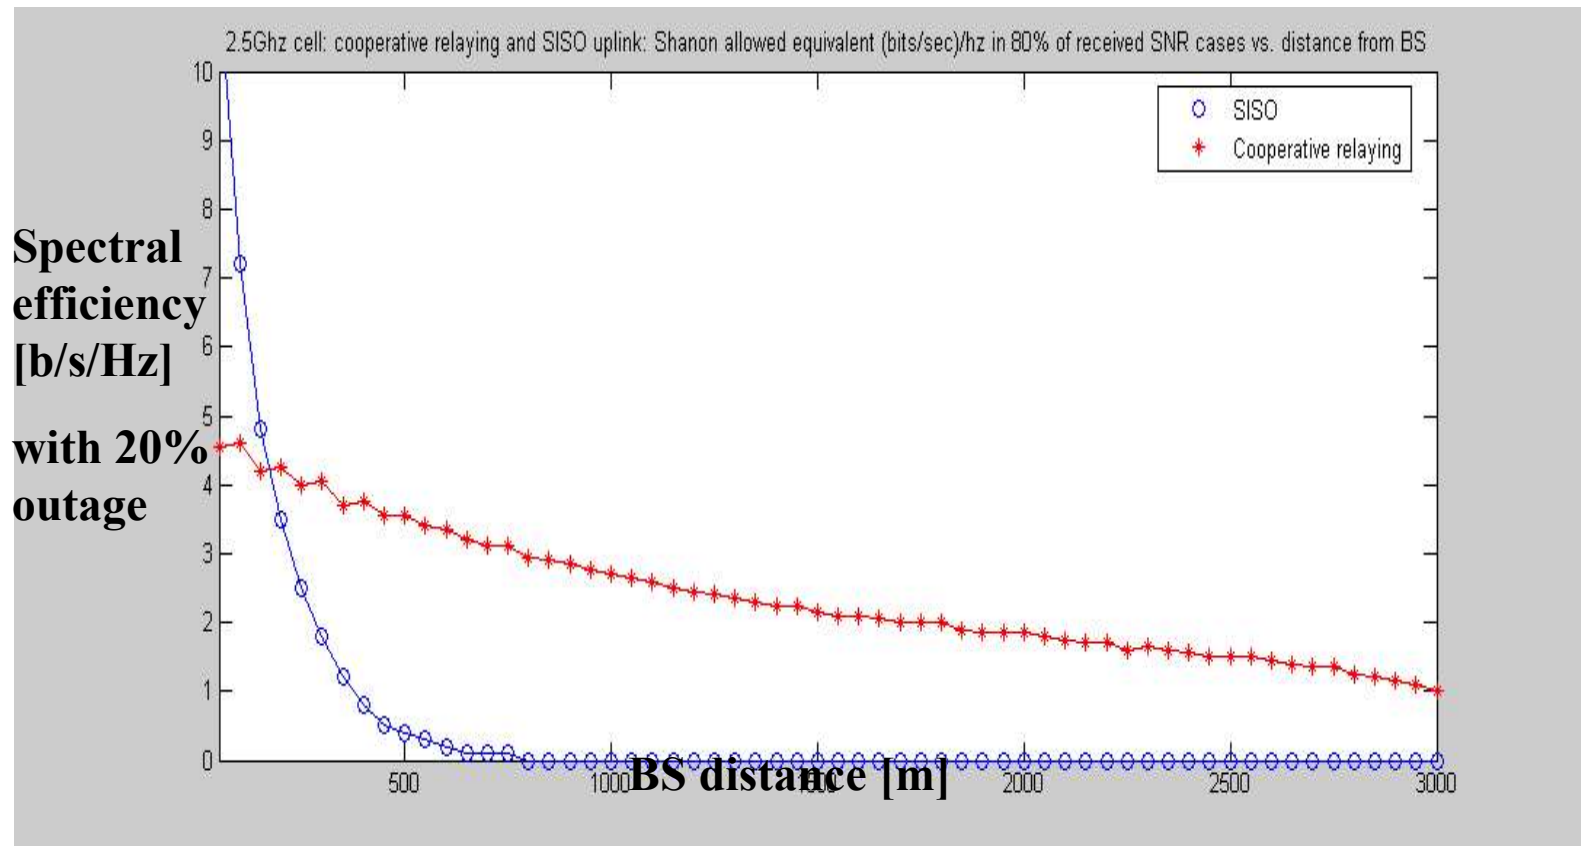

BS distance [m]

Performance : average number of active relays

•Average amount of active relays vs. BS distance

Number of active relays

BS distance [m]
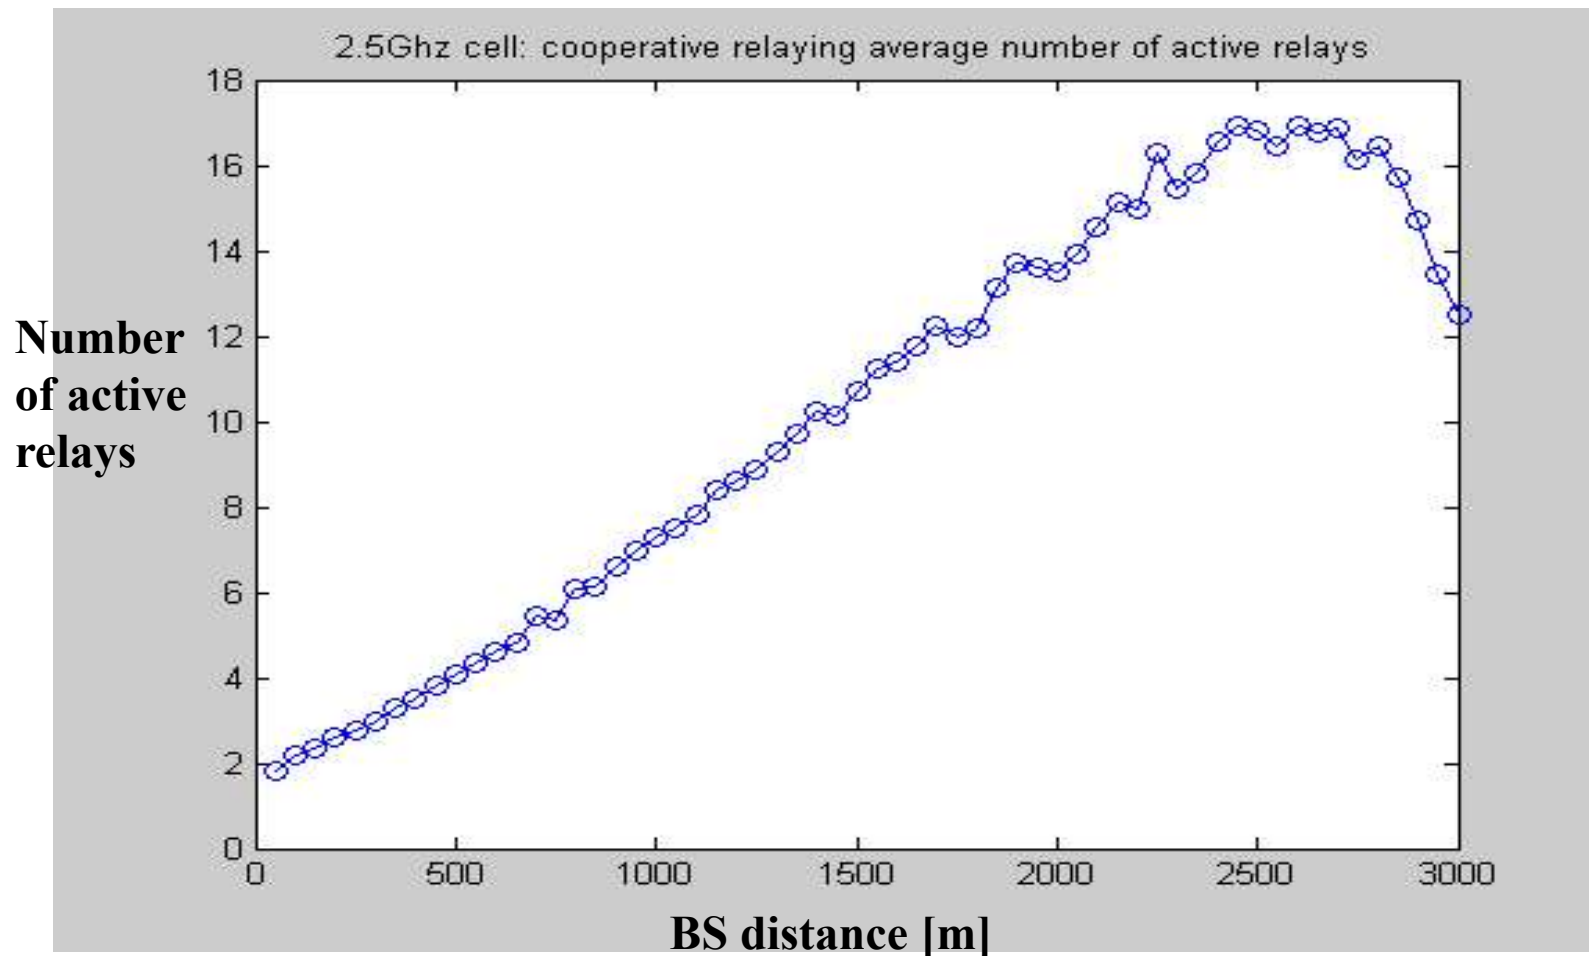

Cooperative relaying – cost effectiveness

- Relay stations are low cost
  - No MAC functions are required
  - Transmitted power as of regular subscribers
- Subscriber cost unchanged
- Increased cell size
  - Quantities of relay stations can be used
- Allows low cost 5-6Ghz frequency networks
  - More relays should be deployed

Suggested cooperative relaying mechanism

- Decode-and-forward at the relaying stations according to reception reliability (e.g. CRC)

- The BS schedules relaying transmissions

- Dedicated uplink and downlink zones

- The relaying stations may be SS with relaying capability or dedicated relay stations

Suggested cooperative relaying implementation

- Backwards compatible
- Several new information elements
- Data bursts relaying
  - Extended throughput with higher modulation-coding schemes
  - Sufficient for SS that can communicate maps and initial ranging directly with the BS
- Preamble, maps and initial ranging relaying
 - Required for extended range and coverage

Information elements for cooperative relaying

- – Indicating bursts to be relayed
- – Relaying allocations and conditions
- – Source and destination of the burst
- – Relaying transmission characteristics
- – Provisioning for diverse algorithms of multi-hop relaying scheduling
- – Provisioning for virtual MIMO

Example of only data bursts relaying

Considerations

- Inter-cell Interference
  - Conditioning downlink relaying by proximity to destination strongly decreases Inter-cell Interference

- Inter Symbol Interference from the spatially diverse relaying stations
  - Cooperating relays are close and relaying transmissions power is low and controlled.

- Limitations on deployment of relay stations
  - Relays transmission power may be similar to SS's.

The bottom line:
"Cooperative relaying ASAP, improvements later"

- – Quick and low cost usage of cooperative relaying is crucial and achievable

- – Allows breakthrough in 802.16 networks

- – Accelerated market penetration

- – Provisioning diverse future algorithms without waiting for them
