Re: This is a response to a Call for Comments IEEE802.16e Handover Adhoc.

Abstract
In this contribution, a method of supporting periodic scanning is provided.

Purpose
This document has been prepared for review by 802.16e Working Group members

Notice
This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release
The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE’s name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE’s sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

Patent Policy and Procedures
The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures <http://ieee802.org/16/ipr/patents/policy.html>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <mailto:chair@wirelessman.org> as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be...
incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site <http://ieee802.org/16/ipr/patents/notices>.
A method of scanning neighbor BSs periodically

1. Introduction

In current IEEE802.16e specification, handover procedure is defined to support the mobility of an MSS. The CINR is the main basis for either MSS or BS to determine handover. To provide reliable CINR information, an MSS should continuously measure CINR of the neighbor BSs and average the measured CINR for a given duration. The consecutive CINR measurement of an MSS is inevitable in all handover schemes such as hard handover, soft handover and fast BS switching. However, in the current specification, the MSS should exchange MOB-SCN-REQ/RSP messages with the serving BS whenever the MSS tries to scan. So the frequent exchange of Scanning related messages cause too much overhead and result in wasting of bandwidth and battery power. Even though the Maximum Length of scan duration is defined to approximately $20\text{sec} \approx 2^{12} \times 5\text{ms}$, this duration is too long for one scanning duration. Thus, in this contribution, we propose a method of enabling an MSS to scan neighbor BSs periodically to reduce the number of scanning request and response messages.

2. Scanning Process for Handover

It can be an implementation issue to decide when an MSS starts to scan neighbor BSs and performs handover to other BSs. In this contribution, however, we assume the operation of an MSS as follows.
An MSS can measure the signal power from the serving BS without any scanning request message. An MSS starts to scan neighbor BSs, if the signal power from the serving BS is lower than a given threshold for $T_{\text{scan}}$ time. The handover procedure will be started, if the signal power of other BS is higher than that of serving BS for $T_{\text{ho}}$ time.

As shown in the Figure1, an MSS should scan neighbor BSs frequently in handover region. The MSS may request periodic scanning if the MSS is considered in the handover region. The serving BS may also order the MSS to start periodic scanning if the MSS is considered in the handover region.

3. Proposed Changes

[Modify the Table 92e – MOB-SCN-REQ Message Format]

6.3.2.3.51 Scanning Interval Allocation Request (MOB-SCN-REQ) message

A MOB-SCN-REQ message may be transmitted by an MSS to request a scanning interval for the purpose of seeking neighbor BS, and determining their suitability as targets for HO.

An MSS shall generate MOB-SCN-REQ messages in the format shown in Table 92e:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Size</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOB-SCN-REQ_Message_Format()</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Management Message Type = 50</td>
<td>8 bits</td>
<td></td>
</tr>
<tr>
<td>Scan Duration</td>
<td>12 bits</td>
<td>Units are frames</td>
</tr>
<tr>
<td>Interleaving Interval</td>
<td>8 bits</td>
<td>Units are frames</td>
</tr>
<tr>
<td>Scan Iteration</td>
<td>8 bits</td>
<td></td>
</tr>
<tr>
<td>Reserved</td>
<td>4 bits</td>
<td></td>
</tr>
<tr>
<td>HMAC Tuple</td>
<td>21 bytes</td>
<td>See 11.4.11.2</td>
</tr>
</tbody>
</table>

The following parameters shall be included in the MOB-SCN-REQ message,

**Scan Duration**

Duration (in units of frames) of the requested scanning period.

**Interleaving Interval**

The period interleaved between Scanning Intervals when MSS may perform Normal Operation.

**Scan Iteration**

The requested number of iterating scanning interval by an MSS

**HMAC Tuple** (see 11.4.11.2 in IEEE Standard P802.16-REVd/D35-2004)

The HMAC Tuple Attribute contains a keyed Message digest (to authenticate the sender).

[Modify the Table 92f – MOB-SCN-RSP Message Format]

6.3.2.3.52 Scanning Interval Allocation Response (MOB-SCN-RSP) message
A MOB-SCN-RSP message shall be transmitted by the BS in response to an MOB-SCN-REQ message sent by an MSS. In addition, BS may send an unsolicited MOB_SCN_RSP. The message shall be transmitted on the basic CID.

The format of the MOB-SCN-RSP message is depicted in Table 92f.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Size</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOB-SCN-RSP_Message_Format()</td>
<td>8 bits</td>
<td></td>
</tr>
<tr>
<td>Management Message Type = 50</td>
<td>12 bits</td>
<td>In frames</td>
</tr>
<tr>
<td>Scan Duration</td>
<td>4 bits</td>
<td></td>
</tr>
<tr>
<td>Start Frame</td>
<td>8 bits</td>
<td></td>
</tr>
<tr>
<td>Interleaving Interval</td>
<td>8 bits</td>
<td></td>
</tr>
<tr>
<td>Scan Iteration</td>
<td>8 bits</td>
<td></td>
</tr>
<tr>
<td>Report mode</td>
<td>2 bits</td>
<td>00 : no report 01 : periodic report 10 : event triggered report 11 : reserved</td>
</tr>
<tr>
<td>Reserved</td>
<td>6 bits</td>
<td></td>
</tr>
<tr>
<td>Scan Report Period</td>
<td>8 bits</td>
<td>Available when the value of Scan Report is set to 01.</td>
</tr>
<tr>
<td>HMAC Tuple</td>
<td>21 bytes</td>
<td>See 11.4.111.2</td>
</tr>
</tbody>
</table>

The following parameters shall be included in the MOB-SCN-RSP message:

**Duration**

Duration (in units of frames) where the MSS may scan for neighbor BS.

**Start Frame**

Measured from the frame in which this message was received. A value of zero means that it will start in the next frame.

**Interleaving Interval**

The period interleaved between Scanning Intervals when MSS may perform Normal Operation.

**Scan Iteration**

The number of iterating scanning interval

**Report mode**

Action code for an MSS’s report of CINR measurement

00 : The MSS measures channel quality of the neighbor BSs without reporting.

01 : The MSS reports the result of the measurement to serving BS periodically. The period of reporting is different from that of scanning

10 : The MSS reports the result of the measurement to serving BS after each measurement.
**Scan Report Period**

The period of MSS’s report of CINR measurement when the MSS is required to report the value periodically

**HMAC Tuple (see 11.4.4.1.2 in IEEE Standard P802.16-REVd/D35-2004)**

The HMAC Tuple Attribute contains a keyed Message digest (to authenticate the sender).

[Add text to section 6.3.20.1.2 MSS Scanning of neighbor BS]

**6.3.20.1.2 MSS Scanning of neighbor BS**

A BS may allocate time intervals to MSS’s for the purpose of seeking and monitoring neighbor BS suitability as targets for HO. The time during which the SS scans for neighbor BS will be referred to as a scanning interval.

An MSS may request an allocation of a scanning interval using the MOB-SCN-REQ MAC Management message. The MSS indicates in this message the estimated duration of time it requires for the scan.

Upon reception of this message, the BS shall respond with a MOB-SCN-RSP MAC Management message. The MOB-SCN-RSP MAC Management message shall either grant the requesting MSS a scanning interval that is at least as long as requested by that MSS, or deny the request. A value of zero for Duration in MOB-SCN-RSP shall indicate the request for an allocation of scanning interval is denied.

Following reception of a MOB-SCN-RSP MAC Management message, an MSS shall scan for a neighbor BS during the time interval allocated in that message. When neighbor BS are identified, the MSS shall attempt to synchronize with their downlink transmissions, and estimate the quality of the PHY channel.

The BS may buffer incoming data addressed to the MSS during the scanning period, and transmit that data after the scanning period. An MSS may terminate scanning and return to Normal Operation anytime. If a Serving BS receives a PDU from an MSS that is supposed to be in scanning mode, the BS shall assume that the MSS is no longer in scanning mode. Any UL message from the MSS to the Serving BS shall interrupt the scanning interval, shall signal the Serving BS that the MSS is still active and has not dropped the connection during its scanning interval.

The BS may allocate group of intervals, which are composed of Scan Duration and Interleaving Interval, for the purpose of reducing the number of MOB-SCN-REQ and MOB-SCN-RSP messages when frequent scanning is required. The MSS scans neighbor BSs, and the BS may buffer incoming data addressed to the MSS during the scan duration. The buffered data is transmitted to the MSS during Interleaving Interval. Scan duration and Interleaving Interval repeat with the number of Scan Iteration. The group of intervals is terminated at any time if the BS sends MOB-SCN-RSP message with setting the parameters (Scan Duration, Interleaving Interval, and Scan Iteration) to all zeros. The MSS may request the periodic scanning. This group of intervals is terminated any time if the MSS sends MOB-SCN-REQ message with setting the parameters (Scan Duration, Interleaving Interval, and Scan Iteration) to all zeros.
After scanning for neighbor BSs using the allocated scanning interval, the MSS shall report the scanning result to the Serving BS through MOB-SCAN-REPORT message periodically based on MAHO report period in MOB-NBR-ADV. Addition to the periodic reporting scheme, the MSS may report the scanning results in case of a specific event which can be that the rank of the received CINR of neighbor BSs is changed. This scanning report may assist Serving BS to recommend suitable BSs for BS initiated handover operation.

[Modify the Figure E.1– Example BS advertisement and scanning (without association) by MSS request]

E.1 Hand-over MSCs

E.1.1 Neighbors advertisement and scanning of neighbors

The following figures describes the messages flow for neighbors advertisement and scanning of neighbors by the MSS request, BS request and periodic scanning of neighbors during hand-over.
Figure E.1—Example BS advertisement and scanning (without association) by MSS request
