**Re:** This document accompanies a comment on IEEE 802.16e/D5a
---|---
**Abstract** | The document contains changes suggested for Scanning Request and Response message to improve Scanning procedure
---|---
**Purpose** | The contribution accompanies comment to be considered within the P802.16e/D5a Ballot Resolution Committee Recirculation
---|---
**Notice** | This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.
---|---
**Release** | The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE’s name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE’s sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.
---|---
**Patent Policy and Procedures** | The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures <http://ieee802.org/16/ipr/patents/policy.html>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <mailto:chair@wirelessman.org> as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site <http://ieee802.org/16/ipr/patents/notices>.
Optimization of Scanning procedure
Vladimir Yanover (Alvarion Ltd.)
Kiseon Ryu, Beomjoon Kim, Ronny Kim (LG Electronics)

1. Background
Section 6.3.20.1.2 "MSS Scanning of available BS" of 802.16e/D5a says:

"In the MOB_SCN-REQ MAC management message the MSS, and in the MOB_SCN-RSP MAC management message the BS shall indicate either Scanning, Scan type = 0, or Association, Scan type = 1, as the intended MSS activity during the Scanning Interval. If Scan type = 1, Association, then the MSS and BS may include, in their respective messages, one or more Association Test BSID. The BS may send over the backbone to the Association Test BS request to allocate non-contention based ranging opportunity, at the appropriate timing interval, for MSS to conduct Association ranging with the Association Test BS. When conducting initial ranging to Association Test BS, MSS shall use allocated non-contention based initial ranging opportunity, if available. Regardless of value of Scan type and the presence of one or more Association Test BSID, MSS may determine and perform any scanning or ranging or Association activities during Scanning Interval at its own discretion."

There are several problems with this procedure.

1. How they neighbor BS may predict when MSS arrives to their channel? Even MSS itself does not know precisely as worst case of DL synchronization latency is large: is it product of (# of frequencies to scan) x (# of GIs to try) x (# of preambles to try etc.) x (estimated # of frames to get synchronized to DL at proper frequency). For the first BS in the list of Test BSs it may be disputable, but certainly not for next BSs where latency of ranging is added by each previous BS.

2. Why should MSS request (and BS approve) for either scanning-only for all BSs or scanning-and-ranging for all BSs?

2. Addition: Problem with Fast Ranging
Fast Ranging IE (8.4.5.4.20) may be placed in the UL-MAP message by a BS to provide a non-contention based initial-ranging opportunity. Additional problem discovered during analysis of Association option is that Fast Ranging IE is not consistent with later updates on OFDMA UL subframe structure where allocations typically are not rectangular and not necessarily fit definitions of Ranging subchannel in 8.4.7.

This is why OFDMA UL-MAP IE format (Table 285) considers (CDMA) ranging allocation a special case. Such allocation (UIUC=12) is provided in terms of OFDMA Symbol offset + Subchannel offset + No. OFDMA Symbols + No. Subchannels rather than in terms of Duration (number of OFDMA slots). In both Network re-entry and Association initial transmission of MSS must be transmission of CDMA code, so Fast Ranging IE should provide allocation in same terms as regular IE for UIUC=12.

3. Suggested remedy for Scanning procedure

</tbody>
</table>

The following parameters shall be included in the MOB_SCN-REQ message,

**Scan duration**
Duration (in units of frames) of the requested scanning period.

**Scan type**
Operation that a MSS intends during Scanning Interval (0) Scanning (1) Association.

**HMAC Tuple (see 11.1.2)**
The HMAC Tuple Attribute contains a keyed message digest (to guarantee the origin and integrity of the message).

If Scan type is set to ‘0’, the following parameters shall be included in the MOB-SCN-REQ message:

**Interleaving Interval**
The period of MSS's Normal Operation which is interleaved between Scanning Durations.

**Scan Iteration**
The requested number of iterating scanning interval by an MSS

**Scan type**
Operation that a MSS intends during Scanning Interval:
0 = Scanning
1 = Association.

If Scan type is set to ‘1’, the following parameters may be included in the MOB-SCN-REQ message:

**Association Test BS ID**

Recommended BS ID field may be included only if an MSS has a candidate available BS. If Scan type = 1 is encoded for specific Recommended BS, it means that MSS calls Serving BS for assistance to make appointment with the Recommended BS for Fast Ranging opportunity to perform association to associate. Multiple Association Test Recommended BS IDs may be included in the MOB-SCN-REQ message.

1: Association |
| Rendezvous time | 15 bit | |
| Association Test BS ID Recommended BS ID | 48 bits | Only included in case of Scan type = 1 “Association” |
| | | |
**Scan duration**
Duration (in units of frames) where the MSS may perform scanning or association for Available BS. If the BS sets this field to be zero to disapprove the MSS's request, all other parameters except HMAC Tuple shall be omitted in the message.

**Start Frame**
Measured from the frame in which this message was received. A value of zero means that **it first Scanning Interval starts will start in the next frame**. If Scan type=1 and multiple Association Test BS IDs are included in MOB-SCN-RSP message. The MSS may perform Association with the first Association Test BS at Start Frame and sequentially perform Association with each following Association Test BS in the message.

**Start type**
0 : BS approval of requested/directed Scanning operation
1 : BS approval of requested/directed Association operation

The Scan type field in MOB-SCN-RSP message shall have the same value as Scan type in MOB-SCN-REQ.

If Scan type is set to ‘0’, the following parameters shall be included in the MOB-SCN-REQ message:

**Interleaving interval**
The period interleaved between Scanning Intervals when MSS may shall perform Normal Operation.

**Scan iteration**
The number of iterating scanning intervals

**Report mode**
Action code for an MSS’s report of CINR measurement:
00: The MSS measures channel quality of the Available BSs without reporting.
01: The MSS reports the result of the measurement to Serving BS periodically. The period of reporting is different from that of scanning.
10: The MSS reports the result of the measurement to Serving BS after each measurement.
11: reserved

**Scan report period**
The period of MSS’s report of CINR measurement when the MSS is required to report the value periodically.

If Scan type is set to ‘1’, the following parameters may be included in the MOB-SCN-REQ message,

**Scan type**
0 : BS approval of requested/directed Scanning operation
1 : BS approval of requested/directed Association operation
Rendezvous time
In case Scan Type = 1 this is an offset, measured in units of frame duration (of Serving BS), when the corresponding Recommended BS is expected to provide Fast Ranging opportunity for the MSS. The offset is calculated from the frame where MOB.SCN-REQ message is transmitted. In case Scan type = 0 the parameter is not applicable and shall be encoded as 0. The Recommended BS is expected to provide Fast Ranging opportunity within 5 frames interval starting from the frame specified by Rendezvous time parameter.

Association Test BS ID
Recommended BS ID
Recommended Association Test BS Recommended BS ID list for Association. If multiple Association Test BS IDs are included in the message, the MSS may perform Association in ascending order of the sequence of Association Test BS ID presented in the message. Serving BS may request, over the backbone, Association Test BS from Recommended BS allocation of non-contention based initial ranging opportunity for MSS Association activity. When conducting initial ranging to Association Test Recommended BS, MSS shall use allocated non-contention based initial ranging opportunity, if available.

[Change in 6.3.20.1.2, p. 128 line 43]

In the MOB_SCN-REQ MAC management message the MSS, and in the MOB_SCN-RSP MAC management message the BS shall indicate either Scanning, Scan type = 0, or Association, Scan type = 1, as the intended MSS activity during the Scanning Interval. If Scan type = 1, Association, then the MSS and BS may include, in their respective messages, one or more Association Test BSID Recommended BS IDs. The BS may negotiate send over the backbone with to the Association Test BS Recommended BS ID request to allocate allocation of non-contention based ranging opportunity, at the appropriate timing interval, for MSS to conduct Association ranging with the Association Test BS ID. When conducting initial ranging to Association Test BS Recommended BS ID, MSS shall use allocated non-contention based initial ranging opportunity, if available. Regardless of value of Scan type and the presence of one or more Association Test BS ID Recommended BS IDs, MSS may determine and perform any scanning or ranging or Association activities during Scanning Interval at its own discretion.

4. Suggested Remedy for Fast Ranging IE

[Change in Table 298g and in the following text, p. 276 line 59]

UIUC 4 bits UIUC ≠ 15. A four-bit code used to define the type of uplink access and the burst type associated with that access.

```java
if (UIUC == 12) {
    OFDMA Symbol offset 8 bits
    Subchannel offset 7 bits
    No. OFDMA Symbols 7 bits
    No. Subchannels 7 bits
    Ranging Method 2 bits
        0b00 - Initial Ranging over two symbols
        0b01 - Initial Ranging over four symbols
        0b10 - BW Request/Periodic Ranging over one symbol
        0b11 - BW Request/Periodic Ranging over three symbols
    reserved 1 bit
        Shall be set to zero
} else {
    Duration 10 bits In OFDMA slots (see 8.4.3.1)
    Repetition coding indication 2 bits
        0b00 - No repetition coding
        0b01 - Repetition coding of 2 used
        0b10 - Repetition coding of 4 used
        0b11 - Repetition coding of 6 used
}
```

CID Basic CID of MSS to which ranging opportunity is allocated. In case UIUC = 12 allocation shall be used for CDMA code transmission as specified in 8.4.7

UIUC UIUC used for the burst.

OFDMA Symbol offset The offset of the OFDMA symbol in which the burst starts, the offset value is defined in units of OFDMA symbols and is relevant to the Allocation Start Time field given in the UL-MAP message.

Subchannel offset The lowest index subchannel used for carrying the burst, starting from subchannel 0. When allocation of mini-subchannels is used this offset will always be even numbered and will point to the first subchannel of the couple splitted into mini-subchannels and used in the allocation.

No. OFDMA Symbols The number of OFDMA symbols that are used to carry the uplink Burst.

No. subchannels The number of subchannels with subsequent indices

Ranging Method Specifies option of CDMA code transmission according to 8.4.7

Duration Indicates the duration, in units of OFDMA slots, of the allocation.
Repetition coding indication
Indicates the repetition code used inside the allocated burst.

HO ID indicator
An indicator to indicate whether HO ID or MAC Address is being used to identify an MSS during HO.

HO ID
-- An identifier assigned to an MSS for use during initial ranging to the selected target BS.
