Venue:
Session #33

Base Document:
IEEE C802.16e-04/230r3

Purpose:

Notice:
This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release:
The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE’s name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE’s sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

IEEE 802.16 Patent Policy:
The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures <http://ieee802.org/16/ipr/patents/policy.html>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <mailto:chair@wirelessman.org> as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site <http://ieee802.org/16/ipr/patents/notices>.
Uplink Power Control Enhancement for 802.16e OFDMA PHY

June 2004
The problem to be addressed

- In OFDMA system, the residual frequency offset results in the non-orthogonality of subcarrier, thus the inter-carrier interference (ICI).
- The power imbalance of subcarriers shall be caused by severe multipath in NLOS, even if there is power control based on the average power of SS.
- These two factors results in the effect, which the stronger subcarriers will kill the weak subcarriers.
The problem to be addressed (cont.)

- Each tile has 4 consecutive subcarriers by 3 OFDM symbols, we show part of subcarriers in one OFDM symbol in the Figure above.

- The existing power control mechanism keeps the average power equal. In subcarrier level, the power imbalance still exists.
The Solution

• The solution: the existing user-based power control + our proposed enhanced power control

• The enhanced power control is based on the power measurement of tile, which is more accurate. It helps to reduce the power imbalance between subcarriers, thus eliminates the near-far effect.

• The performance is evaluated by simulation. The simulation parameters follow the OFDMA uplink PHY in 802.16 D5. Assume that the 70 users communicate with BS simultaneously, and each user occupies one subchannel with _ convolutional coded 16QAM.
The simulation results

Bit error rate and block error rate comparison for user-based and tile-based power control
An Enhanced Power Control IE is defined, which uses the extended UIUC=15 with subcode 0x01.
