Re:	IEEE 802.16m-07/040 - Call for Contributions on Project 802.16m System Description Document.	
Abstract	This contribution contains a proposal for the 802.16m SDD Table of Contents.	
Purpose	To review and adopt the proposed text for the SDD table of contents.	
Notice	This document does not represent the agreed views of the IEEE 802.16 Working Group or any of its subgroups. It represents only the views of the participants listed in the "Source(s)" field above. It is offered as a basis for discussion. It is not binding on the contributor(s), who reserve(s) the right to add, amend or withdraw material contained herein.	
Release	The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16	
Patent Policy	The contributor is familiar with the IEEE-SA Patent Policy and Procedures: < <a href="http://standards.ieee.org/guides/bylaws/sect6-7.html#6">http://standards.ieee.org/guides/bylaws/sect6-7.html#6</a> > and < <a href="http://standards.ieee.org/guides/opman/sect6.html#6.3">http://standards.ieee.org/guides/opman/sect6.html#6.3</a> > Further information is located at < <a href="http://standards.ieee.org/board/pat/pat-material.html">http://standards.ieee.org/board/pat/pat-material.html</a> > and < <a href="http://standards.ieee.org/board/pat">http://standards.ieee.org/board/pat</a> >	

# A Proposed Table of Contents for the 802.16m System Description Document

*Kim Olszewski*  
*ZTE USA, Inc.*

## 1 Introduction

The main purpose of the 802.16m System Description Document (SDD) is to provide a high-level view and concise description of an entire 802.16m system; it should provide a broad overview or quick snapshot of what a 802.16m system is and how it functions. The document's emphasis should be on system breadth rather than system depth. The system view and description should be realized using high-level system block diagrams, protocol stack architectures, system interfaces and concise descriptions that tie all system levels and blocks together. The concise descriptions should not contain detailed text describing specific technology details. Such details will be addressed in future calls for contributions.

The SDD table of contents is a key SDD component because it provides the supporting structure, framework or skeleton that will eventually give an 802.16m system its shape. The SDD table of contents also provides an outline for system development and a list of subject areas that may be addressed in future calls for contributions. This contribution contains a proposed table of contents that may be used as a starting point for the 802.16m SDD. Sections within the proposed table of contents can be improved, extended, added, or removed during SDD development. A section describing the rationale for the structure and sections of the proposed table of contents is also provided. This may be of use during the development of the SDD table of contents.

## 2 Rationale for the Outline Structure and Section Naming

The air interface (PHY and MAC layer) for 802.16m systems must support numerous functional, performance, and operational requirements. These requirements concern various operating environments (residential, office, hot spot, public access, etc), cell ranges (femto, pico, micro, macro, etc.), service classes (voice, data, multimedia, etc.), terminal types (palmtop, laptop, desktop, mobile phones, etc.), in-cell user distributions and densities, traffic flow types, and user profiles (mobile, fixed, nomadic). In addition, the 802.16m air interface must transparently integrate with the air interfaces of legacy 802.16 systems in order to provide for backwards compatibility and a smooth 802.16 product evolution.

The proposed table of contents only addresses the air interface. However, the table of contents begins with sections that describe a network reference architecture so readers can better see the scope of 802.16m system development and how an 802.16m system interfaces with other network entities (see Figure 1). The proposed table of contents is also rooted or aligned with prior 802.16 work in order to support backwards compatibility. To meet the IMT-Advanced requirements and to enable backwards compatibility, the proposed table of contents was designed using references 1-6 within the reference section of this contribution. Sections within 1-6 can be referenced or summarized in order to fill SDD sections that do not require new technology.

The proposed SDD table of contents has a top-down, modular structure that outlines the 802.16m system-level architecture. The top-down, modular structure allows readers to get a quick idea of the structure and building blocks of an 802.16m system by just looking at the table of contents. The top-down, modular structure also facilitates the addition, removal or reorganization of sections if needed during table of contents development.

The table of contents allows for flexibility and variety in future SDD technology proposals that will address 802.16m functional blocks; sections comprising the table of contents are made as general as possible. The rationale for a generalized table of contents is that it does not constrain the system to specific

technologies, only a system structure and core functional blocks that are needed for backwards compatibility. Indeed, proposers of new 802.16 technologies will be constrained or confined if the table of content dictates specific technologies or components. This will impede the evolution of 802.16 systems and will make 802.16 system less competitive compared to similar technologies from other industry groups.

The outline tries to utilize current 802.16 definitions and terminology rather than providing new ones or those used by other standards working groups. This should lessen the development time for the SDD and better support compatibility with legacy 802.16 systems. The introduction of new definitions and terminology should be avoided if they impact 802.16m development time or legacy 802.16 systems. They should only be introduced when necessary or when they improve an existing 802.16 definition or term.

For example, in other standards numerous logical and transport channels are defined. In simple terms a logical channel may be defined as an information stream dedicated to the transfer of a specific type of information (e.g. control or data). On the other hand, transport channels support the logical channels, they are distinguished by physical layer characteristic such as modulation and coding. A MAC layer scheduler is used to perform the mapping between defined logical and transport channels, it schedules user traffic using the most appropriate combination of logical and transport channels. It is the contributors opinion that the definition of transport channels for 802.16m is not needed since the 802.16 equivalent is already provided by interval usage codes via DL and UL burst profiles. The definition of new transport channels for 802.16m may delay SDD development time and complicate backwards compatibility with current 802.16 implementations.

As example case where new definitions can be introduced is define a set of definitions for user terminals. Specifically, within the proposed table of contents the terms fixed, nomadic and mobile access terminals are used rather than subscriber station, mobile station, etc. as used in past. These definitions allow terminals to be classified based on their capabilities and usage scenarios rather than grouping them all together under one non-descriptive name such as subscriber station or mobile station.

### **3 Proposed Table of Contents**

- 1. Introduction, Scope and Overview**
- 2. References**
- 3. Definitions**
- 4. Abbreviations and Acronyms**
- 5. Network Reference Architecture**
  - 5.1 Network Reference Architecture Block Diagram
  - 5.2 Network Functional Blocks
    - 5.2.1 Base Station Controller (BSC)
    - 5.2.1 Base Station Transceiver System (BTS)
    - 5.2.3 Access Terminal (AT)
      - 5.2.3.1 Fixed AT
      - 5.2.3.2 Nomadic AT
      - 5.2.3.3 Mobile AT
    - 5.2.4 Radio Access Network (RAN)
    - 5.2.5 Radio Access Network Gateway (RAN GW)
    - 5.2.6 Core Service Network (CSN)
  - 5.3 Network Functional Block Interfaces
    - 5.3.1 Interface R1 - AT to BTS
    - 5.3.2 Interface R2 - AT to CSN
    - 5.3.3 Interface R3 - RAN to CSN
    - 5.3.4 Interface R4 - RAN to RAN
    - 5.3.5 Interface R5 - CSN to CSN

- 5.3.6 Interface R6 - BTS to RAN
- 5.3.7 Interface R8 - BSC to BSC
- 6. **Air Interface Overview**
  - 6.1 Layer 2 Overview
    - 6.1.1 Sublayer Definitions
    - 6.1.2 Downlink Block Diagrams
    - 6.1.3 Uplink Block Diagrams
    - 6.1.4 OFDMA Overview
    - 6.1.5 Layer 2 Functions and Procedures
    - 6.1.6 Services Provided to Layer 1
  - 6.2 Layer 1 Overview
    - 6.2.1 Downlink Block Diagrams
    - 6.2.2 Uplink Block Diagrams
    - 6.2.3 Layer 1 Functions and Procedures
    - 6.2.4 Services Provided to Layer 2
- 7. **Air Interface Protocol Architecture**
  - 7.1 Control and Management Plane Protocol Stack
  - 7.2 Data Plane Protocol Stack
- 8. **Layer 2 (MAC Layer) Description**
  - 8.1 Service-Specific Convergence Sublayer
    - 8.1.1 Packet Classification
    - 8.1.2 Packet Header Suppression
    - 8.1.3 Packet Delivery and Receipt Acknowledgement
  - 8.2 MAC Common Part Sublayer
    - 8.2.1 MAC Protocol Data Unit Construction
      - 8.2.1.1 Protocol Data Unit Construction
      - 8.2.1.2 Service Data Unit Fragmentation
      - 8.2.1.3 Packing Multiple MAC SDUs into a PDU
      - 8.2.1.4 PDU Concatenation
      - 8.2.1.5 MAC PDU Padding
      - 8.2.1.6 MAC PDU Encryption
      - 8.2.1.7 Protocol Data Unit Transmission
    - 8.2.2 OFDMA Frame Elements
    - 8.2.3 OFDMA Frame Control Fields
    - 8.2.4 OFDMA Frame Element Allocation (Radio Resource Control)
    - 8.2.5 Network Topology Acquisition and Neighbor Discovery
    - 8.2.6 Contention-based Network Access and Network Entry Control
    - 8.2.7 Access Terminal Ranging
      - 8.2.7.1 Initial ranging
      - 8.2.7.2 Periodic ranging
      - 8.2.7.3 Handover ranging
      - 8.2.7.4 Bandwidth request ranging
      - 8.2.7.5 Dedicated ranging
    - 8.2.8 Access Terminal Handover and Mobility Control
    - 8.2.9 Link Access Control Messages
    - 8.2.10 Link Connection Identifiers
    - 8.2.11 Link Bandwidth Allocation
    - 8.2.12 Link Connection Scheduling
      - 8.2.12.1 Queuing Structure

- 8.2.12.2 Service Flows and Classes
- 8.2.12.3 QoS and Flow Control
- 8.2.12.4 Priority Scheduling for Government and Emergency Services
- 8.2.13 Link Data Rate Adaptation and Control
- 8.2.14 Link Error Detection and Retransmission Control
- 8.2.15 Support for Multicast and Broadcast Connections
- 8.2.16 Support for Location Based Service Connections
- 8.2.17 Support for Inter-working with Other Networks
- 8.2.18 Support for Network Coexistence
- 8.2.19 Support for Network Self-configuration and Self-optimization
- 9.1 Security Control Sublayer
  - 9.1.1 Encryption
  - 9.1.2 Access Terminal Registration and Authorization
  - 9.1.3 Key Exchange
  - 9.1.4 Creation and Mapping of Dynamic Security Associations
- 10.1 Relaying Sublayer
- 11. Layer 1 (Physical Layer) Description**
  - 11.1 Adaptive Forward Error Correction Coding
    - 11.1.1 Data Stream Randomization
    - 11.1.2 Convolutional Codes
    - 11.1.3 Block Turbo Codes
    - 11.1.4 Convolutional or Duo-binary Turbo Codes
    - 11.1.5 Low-density Parity Check Codes
  - 11.2 Interleaving
  - 11.3 Adaptive M-QAM Modulations
  - 11.4 OFDMA Symbol Descriptions
    - 11.4.1 Time Domain Descriptions
    - 11.4.2 Frequency Domain Descriptions
    - 11.4.3 Subcarrier Allocations and Spacings
    - 11.4.4 OFDMA Symbol Parameters
    - 11.4.5 IFFT/FFT Modes
  - 11.5 OFDMA Subcarrier Modulations
    - 11.5.1 Cyclic Prefix OFDMA (CP-OFDMA)
    - 11.5.2 DFT-precoded OFDMA (DFT-OFDMA)
  - 11.6 Multiple Antenna Signal Processing
    - 11.6.1 Spatial Multiplexing
    - 11.6.2 Space-time Coding
    - 11.6.3 Cyclic Delay Diversity
    - 11.6.4 Transmit Precoding and Beamforming
    - 11.6.5 Collaborative Spatial Multiplexing
    - 11.6.6 Macro Diversity for Multicast and Broadcast Connections
    - 11.6.7 Hybrid Methods
  - 11.7 Duplexing and Frame Structures
    - 11.7.1 TDD, FDD and H-FDD Duplexing Methods
    - 11.7.2 TDD Frame Structures
    - 11.7.3 Transmit to Receive Switching Times
    - 11.7.4 FDD Frame Structures
  - 11.8 Preamble and Pilot Signals
    - 11.8.1 Downlink Preamble

- 11.8.2 Uplink Preamble
- 11.8.3 Downlink Pilot
- 11.8.4 Uplink Pilot
- 11.8.5 Preambles for Multiple Antenna Signal Processing
- 11.9 Time and Frequency Synchronization
- 11.10 Power Control and Power Efficiency
- 11.11 Link Quality Measurements
  - 11.11.1 Channel Measurements
  - 11.11.2 Noise and Interference Measurements
- 11.12 Inter-cell Interference Mitigation
- 11.13 Spectrum Usage
  - 11.13.1 Spectrum Allocation
    - 11.13.1.1 Fixed Spectrum Allocation
    - 11.13.1.2 Dynamic Spectrum Allocation
  - 11.13.2 Spectrum Restrictions
    - 11.13.2.1 In Band Transmit Spectrum Limits
    - 11.13.2.2 Limits for Out of Band Spectral Emissions
  - 11.13.3 Channel Bandwidth Scalability
  - 11.13.4 Coexistence Scenarios
    - 11.13.4.1 TDD-TDD Coexistence
    - 11.13.4.2 FDD-FDD Coexistence
    - 11.13.4.3 TDD-FDD Coexistence
    - 11.13.4.4 Coexistence between Different IMT-Advanced Networks and RATs
  - 11.13.5 OFMDA-based Spectrum Sculpting
    - 11.13.5.1 Frequency Subset (FS) Operation for Secondary User Traffic
    - 11.13.5.2 Frequency Excision (FE) Operation for Primary User Traffic
    - 11.13.5.3 Fixed and Adaptive Frequency Lockouts
  - 11.13.6 Spectrum Sharing
    - 11.13.6.1 Coordinated Sharing
    - 11.13.6.2 Uncoordinated Sharing
