| Re: | IEEE 802.20 Call for Proposal | |
| Abstract | This document proposes an LDPC coding scheme for Mobile Broadband Wireless Access Systems. | |
| Purpose | For consideration and adoption as a feature supported by 802.20 standard | |
| Notice | This document has been prepared to assist the IEEE 802.20 Working Group. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein. | |
| Release | The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.20. | |
| Patent Policy | The contributor is familiar with IEEE patent policy, as outlined in Section 6.3 of the IEEE-SA Standards Board Operations Manual < http://standards.ieee.org/guides/opman/sect6.html#6.3 > and in <i>Understanding Patent Issues During IEEE Standards Development</i> < http://standards.ieee.org/board/pat/guide.html >. | |

802.20 LDPC Code Proposal

Sung-Eun Park, Seunghoon Choi,
Thierry Lestable, Anna Tee

IEEE 802.20 Plenary Meeting
Orlando, FL, USA
March 11-16, 2007

Outline

- Introduction
- A Proposed LDPC Code Structure
 - Structured LDPC Code
 - Multi-Edge-Type LDPC code
 - Code Length Flexibility
 - LDPC Design for HARQ transmission
 - Efficient Encoding Algorithm
- Packet Formats
- Performance Comparison
- Conclusions

Introduction (1/2)

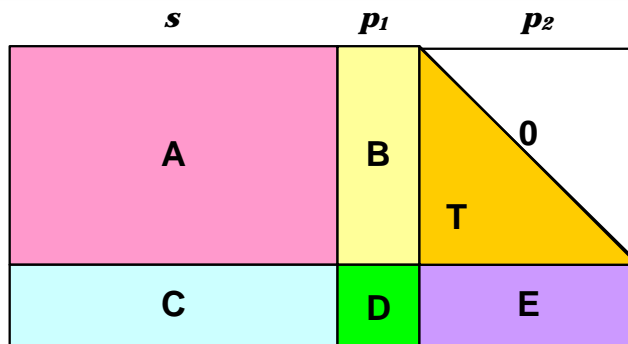

- Current 802.20 Air Interface [1] supports two channel coding schemes
 - Rate 1/5 Turbo code (PCCC) for large packet size ($k > 128$ bits)
 - Rate 1/3 Convolutional code for small packet size ($k \leq 128$ bits)
- Low-Density Parity-Check (LDPC) code is proposed as an optional coding scheme for high data rates (large packet size)
 - Efficient support of Type II HARQ (Incremental Redundancy)
 - Similar or better performance than Turbo codes through all HARQ retransmissions
 - Highly parallelizable encoder/decoder architectures, thus resulting in high-throughput encoder/decoder implementations

Introduction (2/2)

- LDPC codes are fully defined by a sparse parity-check matrix
 - Can also be represented by bipartite graph (Tanner graph)
 - Two types of nodes (variable and check nodes) and edges
- LDPC codes can be decoded by Message-Passing algorithms
 - Pearl's Belief-Propagation (BP) algorithm which passes beliefs in the form of Log-Likelihood Ratios (LLRs) along the edges of the bipartite graph.
 - Optimal only for cycle free tree structure graph codes, but sub-optimal on the graph with cycles
 - The complexity of BP algorithm is proportional to the number of edges in the bipartite graph
 - Due to the sparseness of the parity-check matrix, and thus of the corresponding bipartite graph, the resulting decoding complexity is quite affordable

Structured LDPC Code

| Information | | | | | | | Parity | | | | |
|-------------|-----------|-----------|-----------|-----|---------------|---------------|----------|----------|----------|-----|----------|
| P_{a11} | P_{a12} | P_{a13} | P_{a14} | ... | $P_{a1(n-m)}$ | $P_{a1(n-m)}$ | P_{a1} | I | 0 | 0 | 0 |
| P_{a21} | P_{a22} | P_{a23} | P_{a24} | ... | $P_{a2(n-m)}$ | $P_{a2(n-m)}$ | \vdots | P_{a2} | I | 0 | 0 |
| P_{a31} | P_{a32} | P_{a33} | P_{a34} | ... | $P_{a3(n-m)}$ | $P_{a3(n-m)}$ | P_y | 0 | P_{a3} | I | 0 |
| \vdots | \vdots | \vdots | \vdots | ... | \vdots | \vdots | ... | ... | ... | ... | I |
| P_{am1} | P_{am2} | P_{am3} | P_{am4} | ... | $P_{am(n-m)}$ | $P_{am(n-m)}$ | P_x | 0 | 0 | 0 | P_{am} |

$$P_{L \times L} = \begin{pmatrix} 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & 1 \\ 1 & 0 & 0 & \dots & 0 \end{pmatrix}$$

Permutation matrix should be **cyclic permutation matrix**

Parallelizing Structured LDPC Code

- Full Parallel Implementation [2] – High Throughput, High Complexity
- Semi-Parallel Implementation of Structured LDPC code of size $mL \times nL$
 - Edge Parallel Decoder
 - Basic Parallelization Factor: L
 - $L/2, L/4, etc$ are also possible (implementation issue)
 - Node Parallel Decoder
 - Basic Parallelization Factor: (m, n)
 - $2(m, n), 4(m, n), etc$ are also possible (implementation issue)
- Structured LDPC code well suited for both edge parallel and node parallel approach
- Node Parallel Decoder is matched with the proposed scheme for code length flexibility

Multi-Edge-Type LDPC Code

- Multi-Edge-Type (MET) LDPC codes are generalizations of regular and irregular LDPC codes
- Perform better with lower error floor than standard irregular LDPC codes, while requiring lower complexity

- Type of the edges:** need a detailed degree distribution
- Degree-one variable nodes:** may not sacrifice the threshold
- Punctured variable nodes :** increase thresholds and lower error floors

Code Length Flexibility (1/2)

Code length flexibility is obtained by increasing or decreasing the size of cyclic permutation matrix P

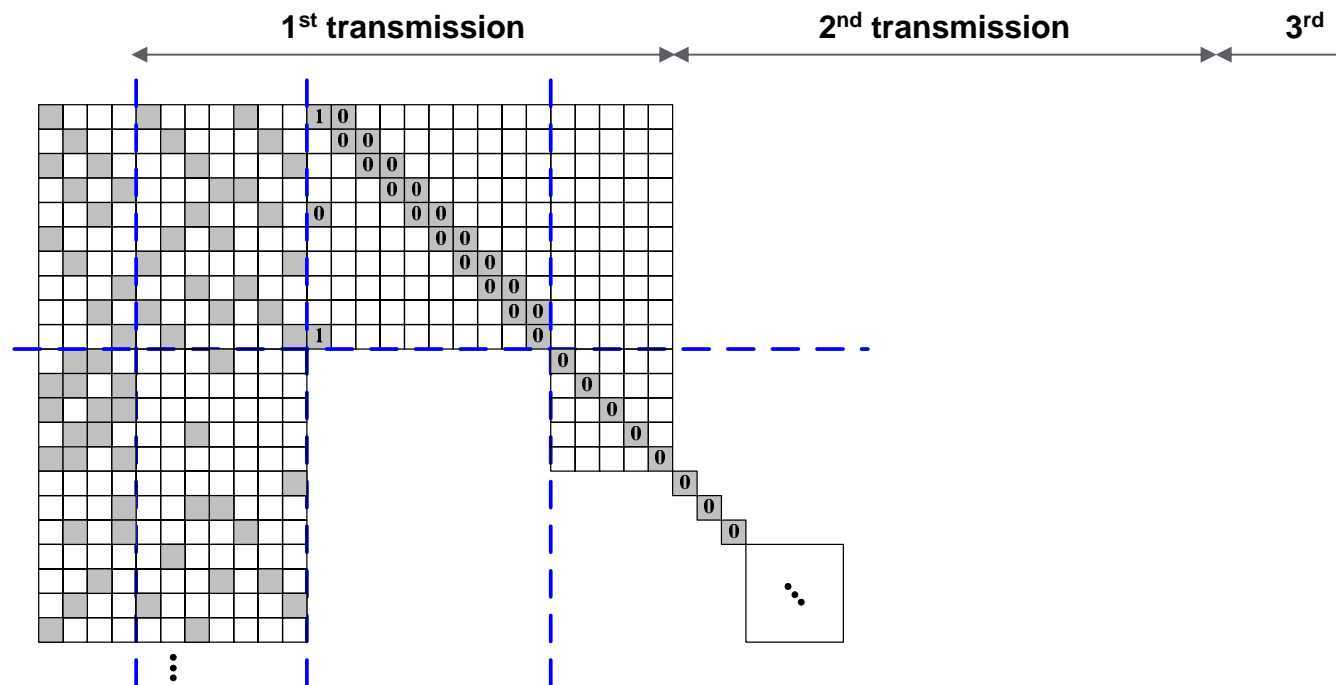

Code Length Flexibility (2/2)

- LDPC codes of variable length need to be expressed by only one parity check matrix (called base matrix), thus reducing the memory storage requirements
- The flexibility with respect to code length is achieved by adopting modulo function on the expansion factor of the non-zero sub-matrices in the parity-check matrix
- Assuming that $(i, j)^{\text{th}}$ element in base matrix is non-zero. Then shift factor $p(f, i, j)$ corresponding to the expansion factor L_f is derived from the original expansion factor $p(i, j)$ by following:

$$p(f, i, j) = \text{mod} \left(p(i, j), L_f \right)$$

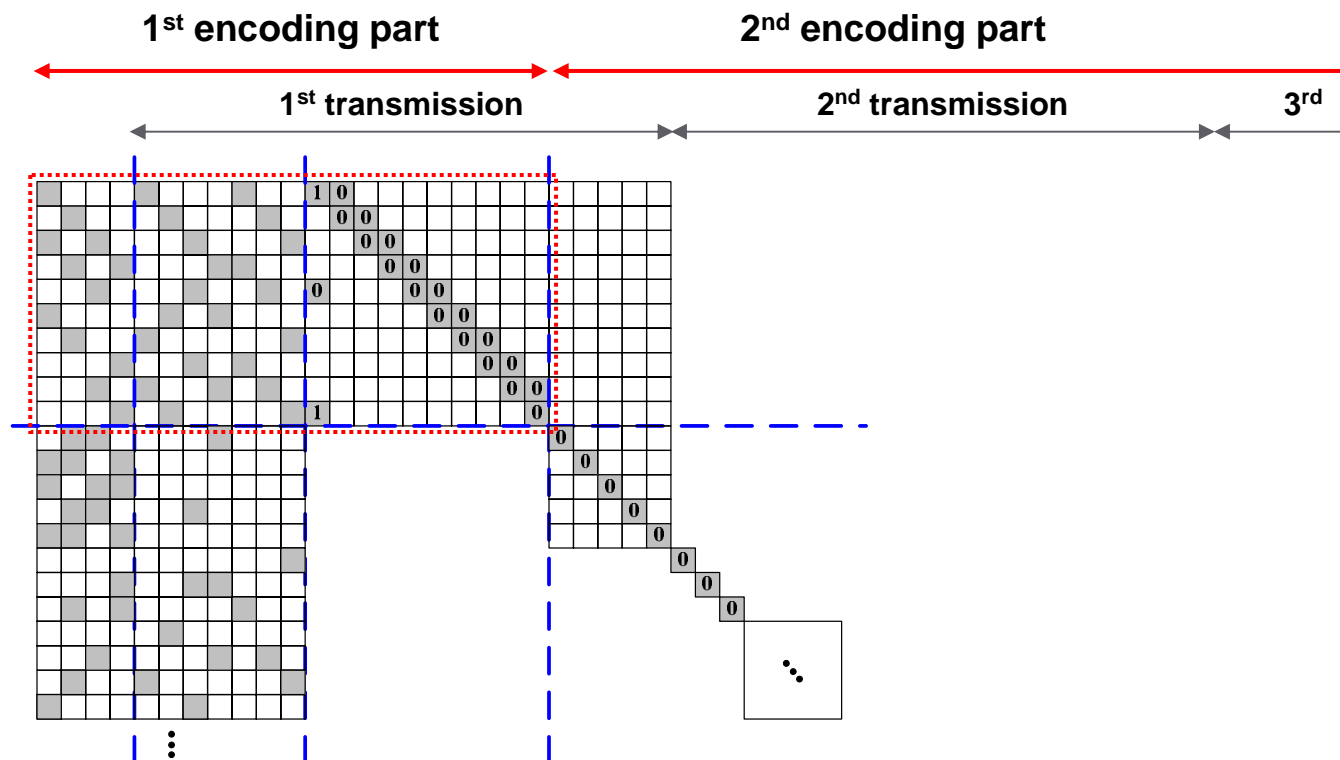

LDPC Design for HARQ

- Construct H matrix of lowest code-rate
- Only a part of codeword is transmitted during each HARQ transmission

Encoding Algorithm (1/5)

- Encoding of proposed LDPC code is accomplished by following two steps:
 - 1st part: Richardson & Urbanke's encoding algorithm [3]
 - 2nd part: Single parity-check coding

Encoding Algorithm (2/5)

- Richardson & Urbanke's encoding algorithm

$$\begin{cases} As^T + Bp_1^T + Tp_2^T = 0 \\ Cs^T + Dp_1^T + Ep_2^T = 0 \end{cases} \quad \begin{cases} (ET^{-1}A + C)s^T + (ET^{-1}B + D)p_1^T = 0 \\ p_1^T = \phi^{-1}(ET^{-1}A + C)s^T, \phi := ET^{-1}B + D \end{cases}$$

Encoding Algorithm (3/5)

- Encoding Procedure
 - Step 1) Compute As^T and Cs^T
 - Step 2) Compute $T^{-1}As^T$
 - Step 3) Compute $E(T^{-1}As^T)$ and $E(T^{-1}As^T) + Cs^T$
 - Step 4) Compute $\phi = ET^{-1}B + D$ and ϕ^{-1}
 - Step 5) Compute $p_1^T = \phi^{-1}(ET^{-1}As^T + Cs^T)$
 - Step 6) Compute p_2^T using $As^T + Bp_1^T + Tp_2^T = 0$
by back-substitution

- Computational complexity of encoding procedure is $O(N) + O(L^2)$.
The second term comes from multiplying by ϕ^{-1} in Step 5)

Encoding Algorithm (4/5)

- The matrix ϕ^{-1} is NOT a sparse matrix
- The multiplication by ϕ^{-1} is a main source to increase the complexity of encoding procedure
- If we can make ϕ an identity matrix, we can skip the multiplication by ϕ^{-1} in the procedure, and can reduce the encoding complexity

Encoding Algorithm (5/5)

- The simple solution to make ϕ an identity matrix [4]:

- B: two non-zero element.
 - Position: 1st and arbitrary.
 - Shift Parameter: A (arbitrary number) and zero
- T: dual diagonal structure (accumulate chain)
 - Shift Parameters: all zero
- D: 1x1
 - Shift Parameter: A (same as 1st non-zero element in B)
- E: one non-zero element.
 - Position: right most.
 - Shift Parameter: zero

Packet Formats (1/2)

- FL Packet Formats [1]

| Packet Format Index | Spectral efficiency on 1 st transmission | Spectral efficiency on 2 nd transmission | Max number of transmissions | Modulation order for each transmission | | | | | |
|---------------------|---|---|-----------------------------|--|---|---|---|---|---|
| | | | | 1 | 2 | 3 | 4 | 5 | 6 |
| 0 | 0.2 | -- | 6 | 2 | 2 | 2 | 2 | 2 | 2 |
| 1 | 0.5 | -- | 6 | 2 | 2 | 2 | 2 | 2 | 2 |
| 2 | 1.0 | -- | 6 | 2 | 2 | 2 | 2 | 2 | 2 |
| 3 | 1.5 | -- | 6 | 3 | 2 | 2 | 2 | 2 | 2 |
| 4 | 2.0 | -- | 6 | 4 | 3 | 3 | 3 | 3 | 3 |
| 5 | 2.5 | -- | 6 | 6 | 4 | 4 | 4 | 4 | 4 |
| 6 | 3.0 | -- | 6 | 6 | 4 | 4 | 4 | 4 | 4 |
| 7 | 4.0 | -- | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 8 | 5.0 | -- | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 9 | 6.0 | 3.0 | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 10 | non-decodable | 3.5 | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 11 | non-decodable | 4.0 | 6 | 6 | 6 | 6 | 4 | 4 | 4 |
| 12 | non-decodable | 4.5 | 6 | 6 | 6 | 6 | 4 | 4 | 4 |
| 13 | non-decodable | 5.0 | 6 | 6 | 6 | 6 | 6 | 4 | 4 |
| 14 | non-decodable | 5.5 | 6 | 6 | 6 | 6 | 6 | 4 | 4 |
| 15 | NULL | NULL | | | | | | | |

Packet Formats (2/2)

- RL Packet Formats [1]

| Packet format index | Spectral efficiency on 1 st transmission | Spectral efficiency on 2 nd transmission | Max number of transmissions | Modulation order for each transmission | | | | | |
|---------------------|---|---|-----------------------------|--|---|---|---|---|---|
| | | | | 1 | 2 | 3 | 4 | 5 | 6 |
| 0 | 0.25 | -- | 6 | 2 | 2 | 2 | 2 | 2 | 2 |
| 1 | 0.50 | -- | 6 | 2 | 2 | 2 | 2 | 2 | 2 |
| 2 | 1.0 | -- | 6 | 2 | 2 | 2 | 2 | 2 | 2 |
| 3 | 1.5 | -- | 6 | 3 | 2 | 2 | 2 | 2 | 2 |
| 4 | 2.0 | -- | 6 | 3 | 3 | 2 | 2 | 2 | 2 |
| 5 | 2.67 | -- | 6 | 4 | 4 | 3 | 3 | 3 | 3 |
| 6 | 4.0 | -- | 6 | 4 | 4 | 3 | 3 | 3 | 3 |
| 7 | 6.0 | 3.0 | 6 | 4 | 4 | 4 | 3 | 3 | 3 |
| 8 | non-decodable | 4.0 | 6 | 4 | 4 | 4 | 4 | 4 | 3 |
| 9 | 4.0 | -- | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 10 | 5.0 | -- | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 11 | 6.0 | 3.0 | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 12 | non-decodable | 3.5 | 6 | 6 | 6 | 4 | 4 | 4 | 4 |
| 13 | non-decodable | 4.0 | 6 | 6 | 6 | 6 | 4 | 4 | 4 |
| 14 | non-decodable | 4.5 | 6 | 6 | 6 | 6 | 4 | 4 | 4 |

Simulation Assumptions

• System Parameters

| | |
|-----------------------------|---|
| Number of resource channels | 4 (110 data symbols per resource channel) |
| Modulation | Modulation order step-down |
| Channel | AWGN |
| Packet Format (PF) index | FL 2, 4, 8, 14 |

• LDPC Code Parameters

| | |
|----------------------|--|
| Code length | 440 modulation symbols for 1 st HARQ transmission |
| Code rate | Defined in PFI |
| Operation Point | 1% FER |
| Decoding Algorithm | Standard Belief Propagation, floating-point |
| Scheduling Algorithm | Flooding |
| Number of Iterations | 25, 50, 100 |

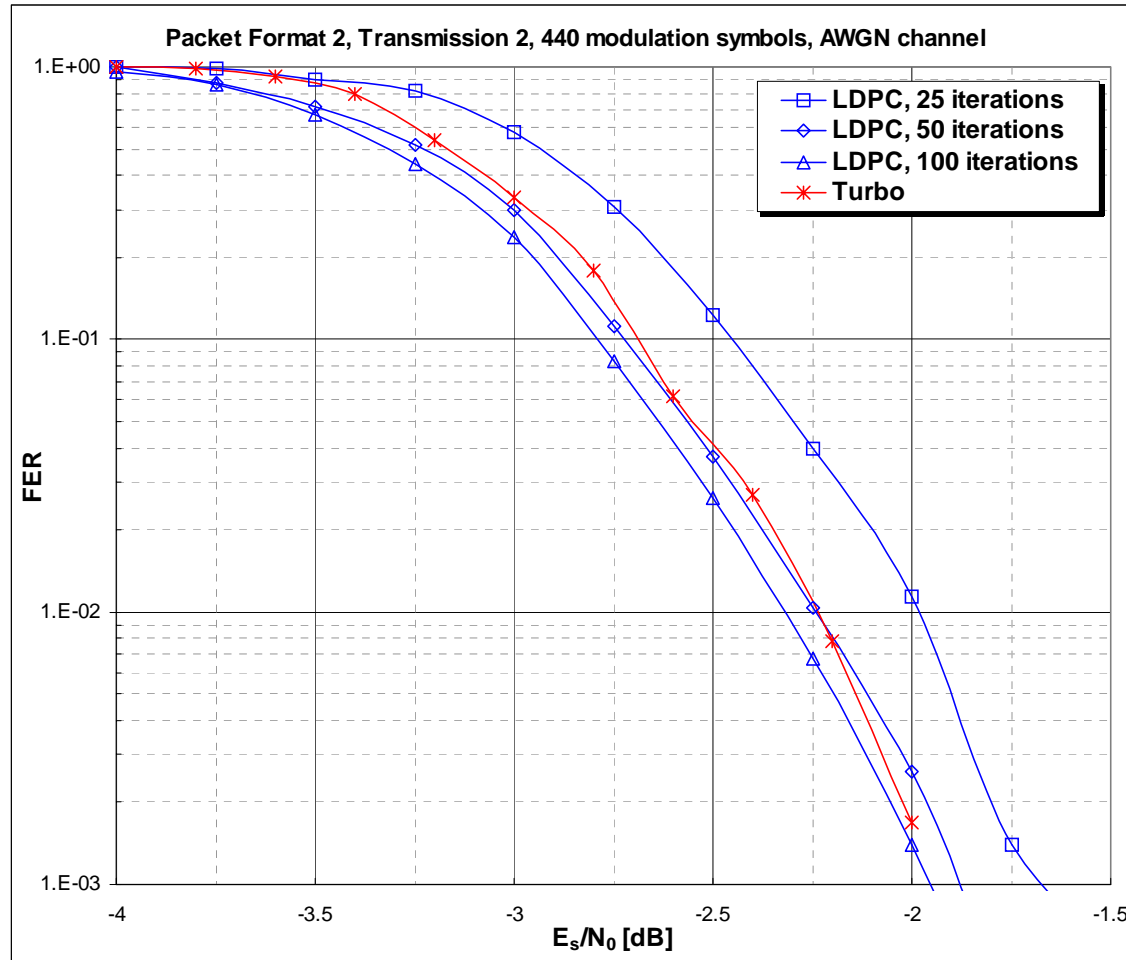

• Turbo Code Parameters

| | |
|----------------------|-------------------------|
| Decoding Algorithm | Log MAP, floating-point |
| Number of Iterations | 12 |

FL PF 2, Transmission 1

FL PF 2, Transmission 2

FL PF 2, Transmission 3

FL PF 4, Transmission 1

FL PF 4, Transmission 2

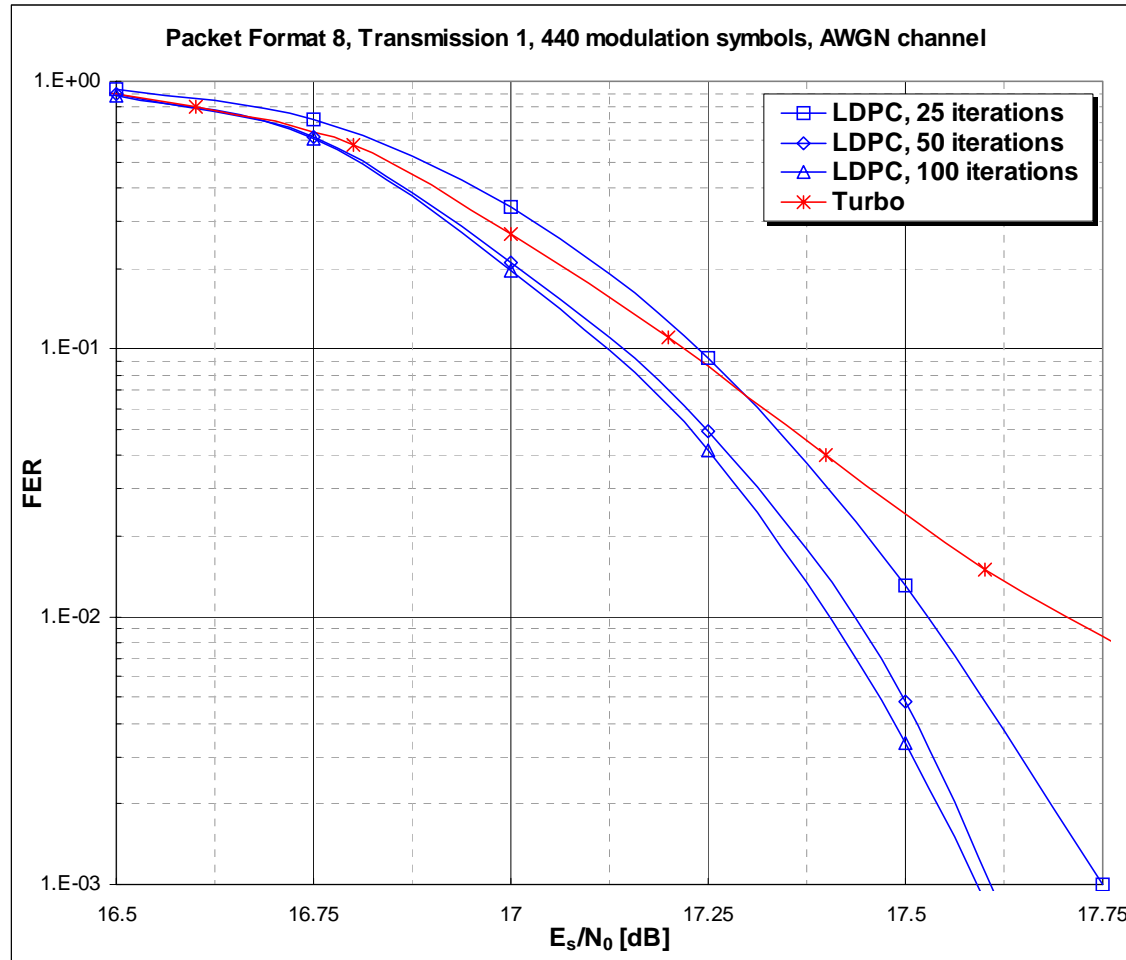

FL PF 4, Transmission 3

FL PF 4, Transmission 4

FL PF 8, Transmission 1

FL PF 8, Transmission 2

FL PF 8, Transmission 3

FL PF 8, Transmission 4

FL PF 8, Transmission 5

FL PF 14, Transmission 2

FL PF 14, Transmission 3

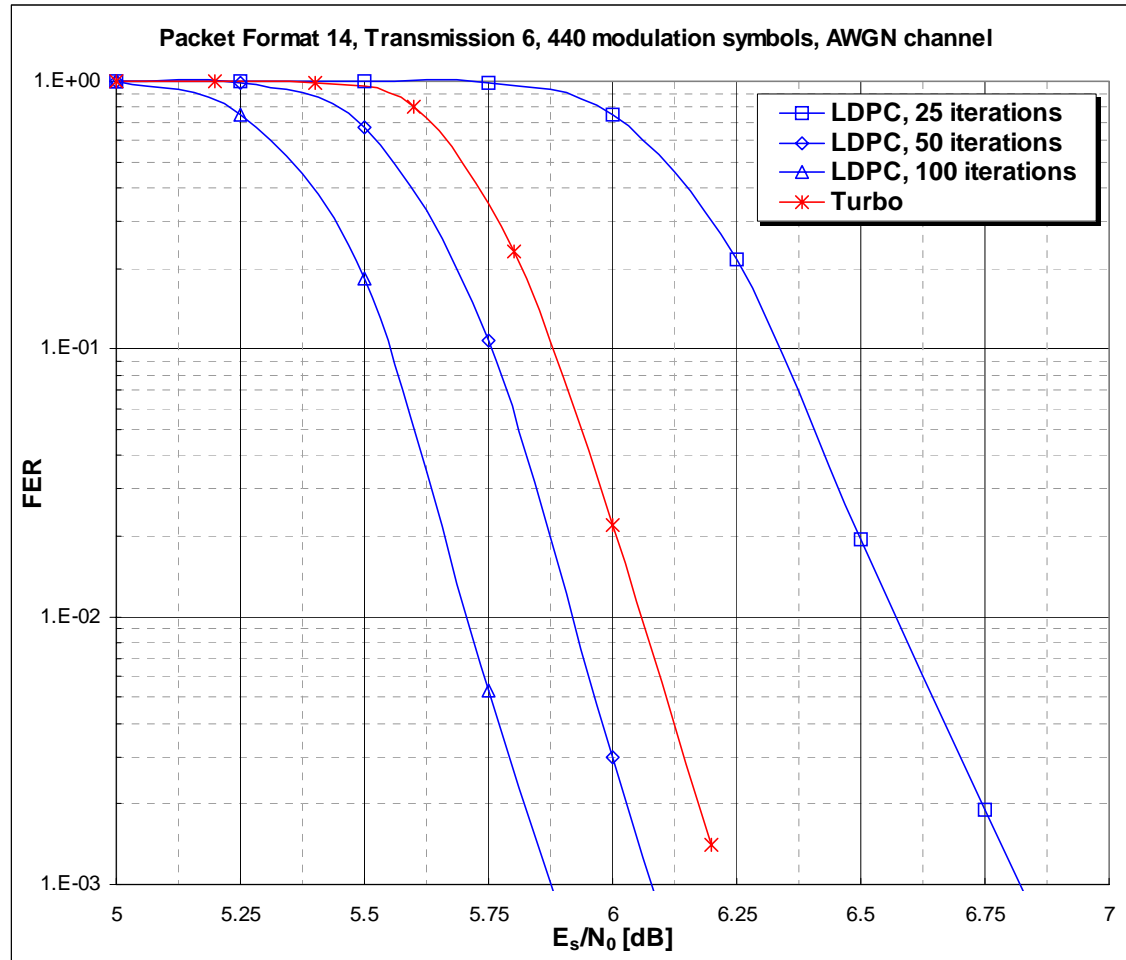

FL PF 14, Transmission 4

FL PF 14, Transmission 5

FL PF 14, Transmission 6

Conclusions

- Proposed LDPC codes offer both efficient support of Type II HARQ (Incremental Redundancy) together with similar or better performance than Turbo codes through all HARQ retransmissions
- Proposed code structure enables highly parallelizable decoder architectures, thus resulting in high-throughput decoder implementations.
