Backfeed v230

Info (not part of baseline)

Changelog:

v230 Added PSE requirement to limit current to I_{rev} , different level depending on V_{PSE} , PD 3P spec reduced to detection range only.

v220 Changes:

- Replace the construct "are not required" by "may" (both in PD and PSE section)
- Replace "cause current to flow" by "source" (unless the PD is sourcing power, it's impossible for current to be sunk into a negative pair).
- Only allow 3P-backfeed from 21 V and up for PDs, but exclude 3P-after-4P
- Cleanup of PSE requirement (got rid of incomprehensible 'range of potentials')
- v212 As presented during the ad-hoc call of May 7

145.2.4 PSE PI

A PSE device may provide power via one or both of the two valid four-conductor connections, named pairsets. A pairset consists of a pair at the positive V_{PSE} and a pair at the negative V_{PSE} . The two conductors associated with a pair each carry the same nominal current in both magnitude and polarity. Figure 145–12, in conjunction with Table 145–3, illustrates the pairsets, which for PSEs are named Alternative A and Alternative B.

PSE are required to switch the negative pairs, and may switch the positive pairs as defined in 145.4.1.1.1. This may lead to both positive pairs providing current in 2-pair mode.

145.2.10 Power supply output

Add new item to Table 145-16 as follows:

Item 17a

Parameter Unpowered negative pair sourced current

 $\begin{array}{ccc} \text{Symbol} & & I_{rev} \\ \text{Unit} & & A \\ \text{Min} & & -- \end{array}$

 $\begin{array}{ll} \text{Max} & 0.0013 \text{ (split: when highest $V_{PSE} > 21$ V)} \\ \text{Max} & 0.0005 \text{ (split: when highest $V_{PSE} \leq 21$ V)} \\ \end{array}$

PSE Type 3, 4

Additional information See 145.2.10.3a

Insert new subclause after 145.2.10.3 as follows:

145.2.10.3a Reflected voltage

, providing power in 2-pair mode,"

When a 4-pair capable PSE provides power in 2-pair mode, whereby two pairs are connected to the positive V_{PSE} , and one pair is connected to the negative V_{PSE} , a single signature PD may reflect a voltage of up to V_{PSE} back onto the unpowered pairset. See 145.3.8.8. The PSE shall not source a current higher than I_{rev} , as defined in Table 145–20, on the negative pair of a pairset when the voltage of that pairset is equal to or lower than the voltage of the other pairset.

This requirement ends up applying at all times, including during 4-pair power delivery. The v220 phrase ", providing power in 2-pair mode," was likely deleted since the PSE is not yet in any power delivery mode during detect and class. The phrase needs to be re-inserted. Due to the complexity in limiting PSE current in this "backfeed" situation, the PD requirements should be as stated in v220, shown below. Moving the PD requirement to the PSE is onerous and moves requirements from the out-of-spec PD to the compliant PSE.

145.3.2 PD PI

Change the note at the bottom of Table 145-20 as follows:

PSEs are required to switch the negative pairs, but not required to and may switch the positive pairs as defined in 145.4.1.1.1. This may lead to both positive pairs providing current in 2-pair mode.

145.3.8 PD power

Change item 18 such that:

- Parameter: Reflected voltage

- Symbol: V_{refl}

Change 10.1V to 21V. Keep "This requirement does not apply" language.
We should not enable PDs which return class currents down the wrong Mode.

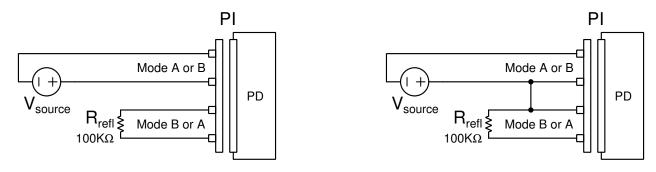

145.3.8.8 Backfeed Reflected voltage

Replace the contents of 145.3.8.8 as follows:

For a single-signature PD, when any voltage in the range of 0 V to V_{Port_PD-2P} max is applied per any of the valid 2-pair configurations, defined in Table 145–20, that have only a single pair connected to positive V_{PSE} (see Figure 145–29a), the voltage on the Mode not connected to the voltage source, with a 100 k Ω resistor connected across that Mode, shall not exceed V_{refl} as defined in Table 145–29.

For a single-signature PD, when any voltage in the range of 0 V to $10.1\,\mathrm{V}$ is applied per any of the valid 2-pair configurations, defined in Table 145–20, including those with two pairs connected to positive V_{PSE} (see Figure 145–29a), the voltage on the Mode with at least one pair not connected to the voltage source, with a $100\,\mathrm{k}\Omega$ resistor connected across that Mode, shall not exceed V_{refl} as defined in Table 145–29. This requirement does not apply if a voltage greater than $10.1\,\mathrm{V}$ has been applied on either Mode until the voltage on both Modes has been less than V_{Reset} for at least T_{Reset} .

For a dual-signature PD, when any voltage in the range of 0 V to V_{Port_PD-2P} max is applied per any of the valid 2-pair configurations, defined in Table 145–20, including those with two pairs connected to positive V_{PSE} (see Figure 145–29a), the voltage on the Mode with at least one pair not connected to the voltage source, with a $100\,\mathrm{k}\Omega$ resistor connected across that Mode, shall not exceed V_{refl} as defined in Table 145–29.

One positive pair connected

Two positive pairs connected
