

### Comment i-451 (145B, P267, L7)

Figure 145B-6 for the staggered option for the dual signature for CC\_DET\_SEQ=1, shows that for the second alternative, DETECTION starts only after the Power up of the primary alternative which is OK but not limited just to this use case. The detection can start also after the detection of the primary alternative as shown by the state machine. We need show it by additional drawing (145-6A), or drawing that shows all possibilities.

#### Proposed Remedy:

*Add the following drawing (Figure 145B-6A) after Figure 145B-6.*

*Add the following drawing (Figure 145B-6A) after Figure 145B-6.*

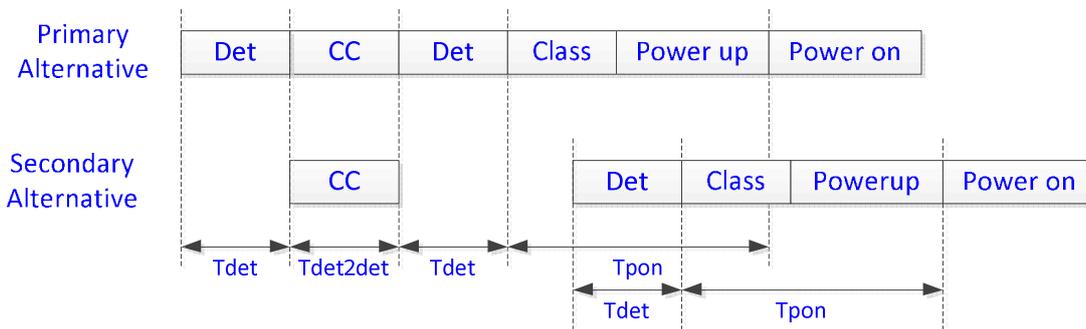

Figure 145B-6A—PSE implementing CC\_DET\_SEQ=1, do\_cxn\_chk result is dual, staggered detection
