# Selection Logic

- **General Rule**

  - **Each physical port is assigned a Key**

  - **Each AgPort is assigned a Key**

  - **Matching the physical port and AgPort keys determines trunk groups.**

    - **If a link is not to be aggregated, its port is given a unique key that matches its aggregator**

- **In the case of ambiguous AgPorts (i.e. more than one AgPort has the same key) include a Recommended (non-normative) default algorithm in specification**
  - **other example algorithms may also be included in an informative annex**
