10GBASE-S PMD

- 10 Gb/s Directly modulated 850 nm VCSEL
- PIN photodiode receiver
- XSBI electrical interface @ 644 Mbits per channel
- Targeted operating distances
 - 26 meters on 62.5 μm 160 MHz·km MMF
 - 33 meters on 62.5 μm 200 MHz·km MMF
 - 66 meters on 50 μm 400 MHz·km MMF
 - 82 meters on 50 μm 500 MHz·km MMF
 - 300 meters on 50 μm 2000 MHz·km MMF

Interoperability Test Configuration

Test Pattern: PRBS $2^{23}-1$ **Signal Speed:** 10.3125 GBd

Interoperation Testing Results

Testing Summary

Fiber Type/ Bandwidth	Distance	% of link length	BER
62.5 μm MMF 160 MHz·km	26	100%	$<10^{-12}$
62.5 μm MMF 200 MHz·km	33	100%	$<10^{-12}$
50 μm MMF 400 MHz·km	66	100%	$<10^{-12}$
50 μm MMF 500 MHz·km	82	100%	$<10^{-12}$
50 μm MMF 2000 MHz·km	450 m	150%	$<10^{-12}$

Conclusion

- The minimum of two independent vendors supplied Serial 10G 850nm transponders.

- All specified fiber types and link distances were successfully operated to less than 10^{-12} BER.
- 2000 MHz-km fibers were tested to 360m and 450m representing a 50% increase in link distance with a BER less than 10^{-12} .
- Initial analysis of the interoperability test link on the 10 Gb/s Link Budget Spreadsheet (Version 2.4.1) suggests the model is too conservative and that perhaps the values such as the k factor should be adjusted from 0.5 to 0.3
- These successful results demonstrate that the 10GBASE-S PMD is feasible.
