Karam, Roger CISCO

*Comment Type* **T** *Comment Status* **A**

We are missing the reason that would enforce the class-violation
So why would I make sure my PD does not exceed the max power allocated
For a class since there is no penalty people may not give this the respect it deserves ...

This becomes a problem when we make use of class 4 to expand the resolution
Of power management or make 'other uses' of class 4 leveraging the PHY paging
capabilities.

*SuggestedRemedy*

Add a note:
A PSE may remove power to a PD that violates the maximum power required
for its advertised class.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

This affects the state machine and will require changes there too.

Karam, Roger CISCO

*Comment Type* **TR** *Comment Status* **A**

I cannot locate the applicable volume of IEC 60060 that defines the .3/50uS waveform required in section 33.4.2 (page 66). I've queried several manufacturer's of impulse test equipment and they can't find any reference to this waveform either.
Is this a valid requirement?
and why are we copying sections out of 802.3 into this draft in the first place?

*SuggestedRemedy*

Correct or Remove from the draft.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

IEC 60060 does not define the .3/50uS waveform. They are defined in 802.3.

Add PG (Protective Ground) to Figure 33-14. Recraft the text so that a signal pair test refers to the PHY clauses rather than duplicates them. Craft the text such that it refers to the testing of the spare pairs.

Added to database on 1/31/2003 at 3:15PM:

Add a protective ground "symbol" to Figure 33-13 to match what is in figure 14-15 and the equivalent figure in clause 40.

Change the existing text:
33.4.2 Fault tolerance
Each wire pair of the PSE or PD shall withstand without damage the application of short circuits of any wire to any other wire within the cable for an indefinite period of time. The magnitude of the current through such a short circuit shall not exceed ILIM max as defined in Table 33-5, item 10.

Each wire pair shall withstand, without damage, a 1000V common-mode impulse applied at Ecm of either polarity (as indicated in Figure 33-13). The shape of the impulse shall be (0.3/50)µs (300ns virtual front time, 50µs virtual time or half value), as defined in IEC 60060, where Ecm is an externally applied AC volt-age as shown in Figure 33-13.

To the following new text:
33.4.2 Fault tolerance

Each wire pair of the PSE or PD when it is encompassed within the MDI shall meet the fault tolerance requirements of the appropriate specifying clause, (See: 14.3.1.2.7, clause 25 and 40.8.3.4). When a PSE is not encompassed within an MDI, the PSE PI shall meet the fault tolerance requirements of this sub-clause.

The PSE PI shall withstand without damage the application of short circuits of any wire to any other wire within the cable for an indefinite period of time. The magnitude of the current through such a short circuit shall not exceed ILIM max as defined in Table 33-5, item 10.

Each wire pair shall withstand, without damage, a 1000V common-mode impulse applied at Ecm of either polarity (as indicated in Figure 33-13). The shape of the impulse shall be (0.3/50)µs (300ns virtual front time, 50µs virtual time or half value), as defined in IEC 60060, where Ecm is an externally applied AC volt-age as shown in Figure 33-13.

Why are we specing a test that the PD must not oscillate around its classification-current leve only,
But when using the forced current method, we would have
A search algorithm step through all class ranges to find the right one,
and it could do so in any sequence that it wishes...

This applies also to page 62- line 31 of the spec.
also applies to page 117- lines 43-44

*SuggestedRemedy*

Please remove the reference to the 'local' current testing for potential oscillation around the PD's class and replace with:

The PD Should not oscillate at any current in the classification-current range. 5ma-50ma

also please fix this in the same manner in the PD classification section of the spec on page 62- line 31...

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

1- This is a spec, and it is placed in the test procedure.

2- why 5 seconds? it seems to me that it take 400msec to unplug a PD
500msec for the detection to take a break say, then say another
1-2 seconds to plug the cable back in, wait 1 sec for the new discovery
and you got about 3 seconds or so...
the concern is that the secretary who plugs a PD the first time in
it gets power within a second as we ask the PSE to do. if she needs to
wait much longer after an unplug would we not make a mess?

it gets better that on line 11, we allow each PD vendor to define this?
why are doing a standard then?

*SuggestedRemedy*

Put the spec in the spec section where it belongs.
5 seconds MAY be too excessive, we may want to revisit this number.

Table 33-2

Tsettele cannot be measured therefore it can't be on the table.
Tsettele is important information hence it should be informative.
In addition hard number (61ms) is not the right thing to do, instead we should supply the equation that derived this number instead and/or require that the voltage or current should be sampled when they reached to their 1% of their steady state.

*SuggestedRemedy*

1. Remove item 5 from the table.
2. Add the requirement for Tsettele to "Note 3" for table 33-2.
3. The comment should read:
"Settling time before voltage or current measurement: Tsettele should be calculated according to the following equation:
Tsettle_min =5(Zsource||33K )*(Cpse+0.12uf) or current and voltage measurements should be taken after voltage or current has reached their 1% steady state condition. Z source (Kohm) is the detection source impedance as specified in Figure 33-7 and Figure 33-8, and where Cpse (μF) is the PSE output port capacitance during detection mode as specified in Table 33-6, item 18."

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

1. Remove item 5 from the table.
2. Add the requirement for Tsettle to "Note 3" for table 33-2.
3. The comment should read:
"Settling time before voltage or current measurement: the voltage and current measurements should be taken after Vdetect has settled to within 1% of its steady state condition."

---

*Cl* **33** *SC* **Table 33-14** *P* **62** *L* **50** # **29**

Darshan, Yair PowerDsine

*Comment Type* **T** *Comment Status* **A**

Table 33-14

The classification max power at the PD should be synchronized with the max PD peak curren which was set for the max PD power (class 0).
The intention was not to allow peak current of 0.4Ap if the max class is 3.8W max as define by class 1.
In this case we would allow 17.6W peak power when the average is only 3.8W.
The idea is to keep the Peak_power/Average_power ratio of class 0 for the other power class as well.
The PSE must supply the power required by the PD (both the average and peak value) plus the power loss on the cable plus some margin.
There is no need to add additional info to the PSE spec due to the fact that the min average power values are defined by table 33-11 and the peak current is defined by the suggested PD spec below in the "Suggested remedy".

*SuggestedRemedy*

Add note ( c ) to the end of note 3 for table 33-14 stating the following:
"The following max peak current value shall be met when the PD is connect to a voltage source 44V<= E<=57V followed by series resistor of 20 ohm .

Eq-1: Iport_peak_max=1.111*Pport_avg/(0.5*E + 0.5*(E- 88.88*Pport_avg)^0.5)

For Pport_avg=12.95W, Eq-1 returns 0.4A for E=44V as specified in items 3. Pport_avg is the max average power allowed by the PD class as described in table 33-11.
(The equation above was derived from the quadratic equation presented at May 2000 meeting. And instead of Port_avg I have used Pport_peak=Pport_avg*14.4/12.95.)

Darshan, Yair PowerDsine

*Comment Type* **E** *Comment Status* **A**

Table 33-14 item 5 defines the ripple and noise at the PD input.
It is not clear if it is the noise generated by the PD and reflected to the PD input or it is the nose generated by the PSE and present at the PD input.
We should specify both noise conditions.
Note 5 for item 5 in the above table says in line 44 that it is the definition for the "output noise at the input terminal of the PD" which can be understood either way.
The hole that I see is that we need to specify the noise generated by the PD (by its power supply as an example) is reflected to the PD input and present at the PD input and some of it at the PSE output.
In addition, we need to specify the noise that generated by the PSE and the PD has to leave with.
In order to keep the objectives of the spec which are to specify the requirements at the PD input and the PSE output and keep interoperability in good shape we need to specify the max noise generated by the PD in the same way we did for the PSE.
Actually the original intent in table 33-14 was to define the noise generated by the PD and reflected to the MDI port however it is easy to fix and define.

*SuggestedRemedy*

1. Change the first sentence in line 44 from:
"output noise at the input terminal of the PD"
to: "The noise at the PD input terminal generated by the PD circuits"
2. Add note c) after line 46:
"PD should handle ripple and noise generated by the PSE and present at the PD input terminal. Thease levels are specified in table 33-6 item 3.
It is advised to the system designer to assume the worst case condition in which both PSE and PD generate noise each at the max levels specified in table 33-6 and 33-14 and the at the port (PSE or PD) a higher noise level may be measured compared to the stand alone case as specified by this standard."

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

1. Change the first sentence in line 44 from:
"output noise at the input terminal of the PD"
to: "The noise at the PD PI generated by the PD circuitry"
2. Add note c) after line 46:
"PD should tolerate ripple and noise generated by the PSE that appear at the PD PI. These levels are specified in table 33-6 item 3.
The system designer is advised to assume the worst case condition in which both PSE and PD generate the maximum noise allowed by Table 33-6 and Table 33-14, which may cause a higher noise level to appear at the PI than the standalone case as specified by this standard."

*Cl* **33** *SC* **33.2.9** *P* **53** *L* **30** # **37**
Darshan, Yair PowerDsine

*Comment Type* **T** *Comment Status* **A**

Due to the fact that only the PD determines the RMS current by its load type, there is no neec to define RMS numbers in table 33-6.
The presence of these rms values may lead to the wrong interpretation that the PSE is responsible to force current limit based on RMS measurements.

The PD spec defines all the data required to limit the RMS current consumed by the PD load.

*SuggestedRemedy*

Figure 33c.3

The 39V zener diode meant to test PSE with foldback current limit.I after more thinking, I believe that this alone is not enough to check this feature and make sure tat the PSE is capable of supplying 400-450mA current during startup (power on).We need to change also ir line 48 the text of Mode 2-2.So here is the deal:If the PSE is equipped with foldback current limit, we should expect the following behavior:the PSE current limit can be any number between Iport>0 to Iport<400mA.It means that the PD input cap will be charged at a slope of Iport/Cpd until the PSE port voltage has reached to 44V. After this point, The PSE must supply 400mA min, 450mA max current for 50ms min, 75ms max time frame. It means that now the slope will be change to 400ma/Cpd to 450ma/Cpd for 50ms min.This behavior shoulc be checked at mode 2-2 of the above test procedure.

*SuggestedRemedy*

1. Remove the 39V zener diode from figure 33c.32.
Replace the text from page 100 line 48 to the following new text:
"Mode 2-2:If the PSE is using foldback current limit, check that the voltage over time behavior is complying to figure 33c.3.1"
Attached the new figure 33c.3.1 (Visio file)

Darshan, Yair PowerDsine

*Comment Type* **TR** *Comment Status* **X**

We need to scan the draft and replace all EN60950 with the "latest update of EN60950-X"
In addition, we need to update lines 10-23 to reflect isolation requirement and not isolation an surge requirements.
Part c) in line 18 page 65 is not belong here due too the following reasons:
- It is surge test and not isolation test. PSE with environment A are note required to meet surge tests.
- Surge tests should not be defined in IEEE802.3af it is out of the scope of the standard to specify it. It is manufacturer issue and it depends on installation and environment type. Environment A does not require meeting surge tests.
If we want this anyway, we need to reduce the pulse parameters to 10us/700u type, which is defined in updated versions of IEC60950.

*SuggestedRemedy*

1. scan the draft and replace all EN60950 with the "latest update of EN60950-X"
2. Delete Part c) in line 18 page 65.

*Comment Type* **T** *Comment Status* **A**

I am suggesting to delete the applied current method for the classification function from the draft.
I know that it was suggested a while ago by Thong however now it is our last chance to consider it again.
I came to the conclusion that it is better from PD and PSE side point of view.
I am suggesting it now due to some thinking I have made about what can be the possible implications if the PSE is equipped with foldabck current limit.
Probably with good design from the PSE and PD side we can overcome all problems and may be no problem at all however due to the fact that most of known PSE vendors support or will support the Voltage method, I don't see a reason to keep the current method.
Lets discuss it in the meeting.

*SuggestedRemedy*

Scan the draft for the applied current method and remove it.

*Proposed Response* *Response Status* **C**

ACCEPT.

Technically, forced current presents a stability problem for the PD. The forced voltage method is technically more robust. Elimininting this removes an unecessary option.

Why we are combining auto MDI function ,which is the phy feature/ function (s/w controlled) with the power feeding ?
I think that we have to specify two pinout alternatives A1- MDI and A2 -MDI-X without relation to auto MDI feature . I have two reasons for that.

1. Let's assume I have implemented PSE and used alternative A1 for MDI pinout and one day in the future I will activate the auto MDI feature of my PHY on my PSE that is in the field right now. Immediately my PSE device is not compliant with the standard as we have to do the A2 pinout for auto MDI PSE.

2.Let's assume there is PD that isn't implement autoMDI (without the diode bridge ), This PD was plugged in and worked OK with crossed cable conncted to PSE with MDI , now if we change to new PSE with auto MDI feature using the same cable plug to this PD , it will not be powered as the voltage feeding was crossed and we confuse the market.

*SuggestedRemedy*

we have to specify two pinout alternatives A1- MDI and A2 -MDI-X without relation to auto MDI feature

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

change Table 33-1 from "(MDI-X or Auto-MDI-X)" to "(MDI-X or Auto-MDI-X which default to MDI-X)" and from "(MDI)" to "(MDI or Auto-MDI-X which default to MDI)"

change sentence on page 39, line 45 to "PSEs that use automatically configuring MDI/MDI-X ("Auto-MDI-X") ports may implement either Alternative A polarities, as any cabling system which will align power will automatically align the data."

Burke, Thomas — Underwriters Laboratori

*Comment Type* **E** *Comment Status* **A**

The sub-clause references to IEC 60950 in this sub-clause (and 33.5.1) are not accurate with the latest version of the Standard for Safety of Information Technology Equipment, IEC 60950 1, First Edition. The present sub-clause references (i.e., 5.3.2) are to the Second Edition of IEC 60950. The Second edition has superseded by IEC 60950 Third Edition in April 1999 and IEC 60950-1 First Edition in October 2001. (IEC TC108 has changed the structure of IEC 60950 to include a general Part 1 Standard, IEC 60950-1, with additional (pending) Part 2 Standards (e.g., IEC 60950-xx) to cover specific products. This is why IEC 60950-1 First Edition supersedes IEC 60950 Third Edition.) For the tests in parts a) and b) of 33.4.1, the correct reference in IEC 60950-1 is Sub-clause 5.2.2 instead of 5.3.2. Also, the word "section' is incorrectly used in place of standard IEC terminology "sub-clause."

*SuggestedRemedy*

The concluding phrases of parts a) and b) of 33.4.1 (lines 16-17), and the middle of the last sentence of 33.4.1 (line 22) should be changed from "...in Section 5.3.2 of IEC 60950" to "...in Sub-clause 5.2.2 of IEC 60950-1, First Edition."

*Proposed Response* *Response Status* **C**

Burke, Thomas — Underwriters Laboratori

*Comment Type* **T** *Comment Status* **A**

Note - This comment may supersede and make irrelevant my previous comment on 33.4.1. It appears that the requirement in this sub-clause is intended to both require and test separation/isolation between "port device circuits" and the "PI" or power interface (which apparently may be subjected to transients). However, I note that generally this type of separation is only required by safety standards between different low-voltage secondary circuits when the interface may be routed outside the building, i.e., topologies with so-called outside plant connections. I assume the IEEE P802.3af working group has adopted such a requirement because some Ethernet topologies may be routed outside plant, e.g., campus environment. If this is so, I note that IEC 60950-1 already has a similar requirement between Safety Extra Low Voltage (SELV) circuits and other circuits routed outside plant (e.g., TNV-1 telecommunication circuits such as ISDN). However, the test parameters in IEEE P802.3af and IEC 60950-1 are different.

In sub-clause 6.2 of IEC 60950-1, two options exist instead of three:
- A steady state test of 1000 V a.c. (1500 V if Australia considered too); or
- An impulse test consisting of a 1500 V, 10/700us waveform, applied 10 times, with a 60 second interval between pulses.

Also, 6.2 of IEC 60950-1 anticipates surge suppression may be used in such circuits, so the 2 Mohm/500 Vd.c. pass/fail criteria in lines 22-23 of IEEE P802.3af are too simplified when compared to the similar wording in 6.2.2.3 of IEC 60950-1 for similar circuits containing surge suppression.

It is important to point out the above because (a) IEC 60950 would only require such separation/isolation for Ethernet topologies with potential outside plant routing (a companion document to IEC 60950-1, IEC TR62102, Classification of Interfaces for Equipment to Be Connected to Information and Communications Technology Networks, only assumes 10Base5 to be subjected to such transients, not 10Base2 and 10BaseT (it hasn't addressed 100BaseT yet)); and (b) it appears that the exact same Ethernet circuits in the exact same products may end up being subjected to two sets of requirements/tests with different parameters, even though the tests are addressing the same hazards. This does not appear to be an ideal situation for manufacturers.

*SuggestedRemedy*

The P802.3af working group should revisit the requirement in 33.4.1 and reconfirm the intent of the isolation requirements in 33.4.1 of IEEE P802.3af/D4.0. If the working group agrees such separation/isolation remains sound, the working group should consider whether the requirements in sub-clause 6.2 of IEC 60950-1 are more appropriate than those in the presen IEEE P802.3af/D4.0. If this conclusion is reached, 33.4.1 should be completely revised to state: "The PSE and PD shall each provide electrical separation between the port device circuits, including the frame earth (if any) and all PI leads. This electrical separation shall be i accordance with the separation requirements between SELV circuits and telecommunication network connections in sub-clause 6.2 of IEC 60950-1 (i.e., same as between SELV and TNV 1)," or similar. I note that SELV circuits are already mentioned in 33.1.2 of the document, so there should not be a problem referencing them here too.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

Added to the database 1/31/2003 at 3:20PM:

33.4.1 Isolation

The PSE shall provide electrical isolation between the PI device circuits, including frame ground (if any) and all PI leads.

The PD shall provide electrical isolation between all external conductors, including frame ground (if any) and all PI leads.

This electrical separation shall be in accordance with the separation requirements between SELV circuits and telecommunication network connections in sub-clause 6.2 of IEC 60950-1:2001.□□□

This electrical separation shall withstand at least one of the following electrical strength tests:

a) 1500 Vrms steady-state at 50-60 Hz for 60 sec, as specified in IEC 60950-1:2001.

b) An impulse test consisting of a 1500 V, 10/700us waveform, applied 10 times, with a 60 second interval between pulses, as specified in IEC 60950-1:2001.

NOTE: (not part of the text of P802.3af 4.1)

P802.3af has added additional requirements for safety with the addition of power and requires IEC 60950-1:2001. Currently, 802.3-2002 references IEC 60950:1991. A maintainence request to compare IEC 60950:1991 and IEC 60950:2001 to determine if the 2001 edition can be used as the reference in 802.3

Miller, Alan — Hubbell Premise Wiring

*Comment Type* **T** *Comment Status* **R**

The statement forms a restriction on an issue that falls outside the scope of IEEE in general, and 802.3af document in particular, stated as □to allow devices to draw power from the same generic cabling of 10BASE-T and 100BASE-T (and 1000BASE-T).□ The specification of □channel□ and □permanent link□ is the scope of TIA-TR42 and corresponding IEC committees. Work is currently being done, particularly in the TIA to specify the generic cabling for low power applications. The IEEE standards should only refer to those standards for guidance, rather than including specific details that may alter the course of generic cabling development. The possibility should be left open for the cabling standards to evolve in suppor of new applications.

For example, there have been several requests to allow a Midspan PSE in a Consolidation point or workstation outlet. Although this is not allowed in generic cabling at this point, it is possible and should not be prohibited in IEEE 802.3af standard. The development of equipment that is IEEE 802.3af compliant while not specifically in compliance with generic cabling standard should be allowed. As these and other future applications evolve, the cablinç standards would come into harmony with the IEEE standard based on user acceptance.

Likewise, the IEEE 802.3af standards should not restrict changes to the non-signal pairs. Although preference has been given to end-point devices in the PD detection sequence, there may be other applications that may require temporarily or permanently altering the continuity of the □signal pairs□. For example, the detection of non-compliant, legacy devices may require performing detection on the □traditional□ signal pairs for 100BASE-T in addition to performing the detection on the □spare pairs□. The intent of the 802.3af should be to promote the use of low voltage power on the LAN and not restrict legacy or future devices, applications and functionality.

Finally, the IEEE802.3af document actually suggests certain implementations by allowing changes to the □channel□, such as end point (power from the switch), Midspan box and Midspan patch cords. On the other hand, it prohibits certain other possible implementations such as a Power Patch Panel, Power Consolidation point or Power Workstation outlet by the use of □shall not alter transmission requirements of the permanent link□. Thus, the restrictior on changes to the cabling can be viewed as an attempt to protect the status quo of cabling, rather than looking towards the best possible future implementations.

*SuggestedRemedy*

(in order of preference):

Suggestion 1:

□Configurations with the Midspan PSE in the cabling channel shall adhere to the transmissioı requirements of the □permanent link□ or □channel□ in the specified frequency range from 1MHz to the maximum frequency of the system. The inclusion of the Midspan PSE in the channel may reflect in the channel signal continuity for two pairs only, as spare pairs on whicl power is injected may be discontinued at the midspan PSE.□

Alternate 1:

□Configurations with the Midspan PSE in the cabling channel should not alter the

transmission requirements of the □permanent link□. The inclusion of the Midspan PSE in the channel may result in channel continuity for the signal pairs only, as spare pairs on which power is injected may be discontinued at the Midspan PSE.□

*Comment Type* **T** *Comment Status* **A** *sm*

The second paragraph of the behavior should be updated to include reference to the fact that PD Detection will not take place when the PSE is disabled through the PSEAdmin attribute. Note this assumes that PD Detection is indeed disabled by the PSEAdmin attribute. This relates to the fact that it is not clear from Clause 33 if the PD Detection function is gated by the state of the mr_pse_enable variable of the State Machine. Figure 33-5, the description for the PSE Enable bit (11.0) and the PSEAdmin behavior all imply that PD Detection is disabled To quote the text for bit 11.0 'The PSE function shall be disabled by setting bit 11.0 to logic zero. When the PSE function is disabled by this bit, the MDI shall function as it would if it had no PSE function.'. When the text for the PD Detection (33.2.4) is examined however there doesn't seem to be any link to the register bits.

*SuggestedRemedy*

Change the second paragraph to read 'The enumeration 'test' indicates that if a valid PD is detected the PSE will then proceed to attempt to supply power. The enumeration 'test' indicates that if a valid PD is detected power will not be supplied. If a Clause 22 MII or Clause 35 GMII is present, then this will map to the Detection Test Control bits specified in 33.6.1.1.2

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

the SM overhaul has eliminated detection test mode in favor of detection counter in the MIB, which is being handled by the MIB AdHoc.

*Cl* **30** *SC* **30.9.1.1.6** *P* **14** *L* **45** # **112**

Law, David 3Com

*Comment Type* **T** *Comment Status* **A** *sm*

This attribute reflects the state of the PSE rather that the state of the PD Detection function as it includes such information as to if the PSE is supplying power or not. The first paragraph of the behavior needs to be updated to reflect this.

*SuggestedRemedy*

Change the text 'A read-only value that indicates the current status of the PD Detection function specified in 33.2.6.' to read 'A read-only value that indicates the current status of the PSE'.

30.9.1.1.6 aPSEPowerDetectionStatus
==========

Not too sure if the attribute name is still appropriate since it now reports more than just the Power Detection Status - suggest aPSEState is a possibility.

Enumeration 'disabled'
---

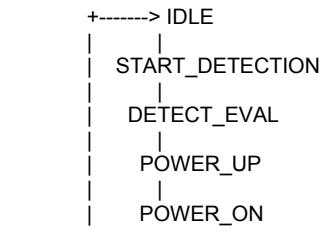
I think this enumeration needs updated to match the variables changed name and the its enumeration as it is not a Boolean.

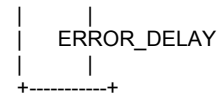
Suggested new text: 'The enumeration "disabled" indicates that the PSE State diagram (Figure 33-5) is in the state IDLE due to the variable mr_pse_enable = disabled.

Note - I would still prefer to see separate 'IDLE', 'ERROR' and 'FAULT' states rather than having to predicate the enumerations based on the variable that is leading the PSE state diagram to be in the 'IDLE' state. See state machine comments below.

Enumeration 'deliveringPower'
---

The problem that I see with the current definition of this enumeration is that in the situation when there is an overload or a short the state machine will continually cycle through:





The problem is that the as currently defined the attribute will return the enumeration 'deliveringPower' while the state machine is in the state POWER_UP or POWER_ON hence in this error condition the attribute will be indicating 'deliveringPower' for tlim or tolvd depending on the error. Another enumeration will occur during the other states however it seems to me to be misleading to indicate 'deliveringPower' in this situation.

I therefore suggest that an additional condition be added to the 'deliveringPower' enumeration that states this value is only reported once the state machine has been in the POWER_ON state for in excess of tlim max (since tlim max and tovld max are the same value).

Suggested new text: 'The enumeration "deliveringPower" indicates that the PSE State diagram is in the state POWER_ON for a duration grater than tlim max (see Table 33-5).'

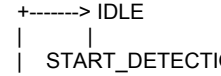
Note - While I believe this delay should be imposed upon this enumeration being indicated by this attribute I do not believe it is necessary to have this delay on the register. The agent software can provide this delay based on a live register bit - read the register, if the value is deliveringPower power wait for the delay, read again, if the value is still deliveringPower then set the attribute to the enumeration deliveringPower.

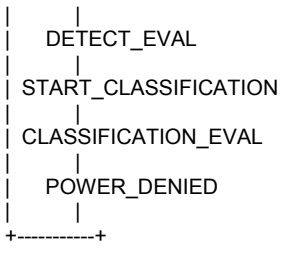
Enumeration 'fault'
---

The current definition of this enumeration seems to be okay but an overload or short condition will not cause the enumeartion 'fault' to be indicated (assuming the correction to the state machine described below). I assuume this okay, it seems to be to me - the counter aPSEOverCurrentCounter will be continually incrementing in this condition and it is this that should be used as an indication of the particular fault condition.

Indication of Power being denied to a PD
---

I believe this condition should be indicated by a register bit and a new MIB attribute. Imagine the situation where a PD is requesting power yet the PSE hasn't sufficient power. If this situation continues I believe that the state machine will continually rotate through the following states:





At the moment there is no indication to the user this is happeneing, all they know is they have correctly connected a PD to a PSE yet the PSE is failing to power the PD. Since the POWER_DENIED state is a transitory state and the PSE will very quickly - instantaneously from what I can see - return to the 'searching' enumeration, I don't think we can cover this situation by adding a new enumeration to the aPSEPowerDetectionStatus attribute. Instead I think that a new counter attribute should be added.

Suggested new text:

30.9.1.1.X aPSEPowerDenied
ATTRIBUTE
APPROPRIATE SYNTAX:
Generalized nonresettable counter. This counter has a maximum increment rate of ????
BEHAVIOUR DEFINED AS:
A count of the number of times that the PSE denies power to a PD. This counter is incremented when the PSE State diagram (Figure 33-5) enters the state POWER_DENIED.

Note - As far as the register bits are concerned I guess we need a sticky bit to be set when this state is passed through to support our new counter attribute.

IETF MIB issue
---

In addition, while I know its a bit out of scope, I think we should consider the enumerations the IETF has for its equivalent of the aPSEPowerDetectionStatus attribute - if not we may end up without the supporting hardware for their enumeration. Of course alternatively we could suggest that they delete this particular enumeration. Anyway, the IETF have an additional enumeration 'denyLowPriority' which as best as I can see sort of maps to the POWER_DENIED state in the new state machine although they also seem to allow a port to be powered down if a higher prority port requests power - something we certainly do not support.

I however belive they have the same issue that we have with the state POWER_DENIED. The 'denyLowPriority' enumeration will be a transitory state and the PSE will very quickly return to the 'searching' enumeration. In the case of

the IETF behaviour where this transition through the 'denyLowPriority' enumeration to the 'searching' enumeration occurs due to a higher priroty port bring powered the state machine will then start to rotate continually through the states I described above.

In summary therfore I don't see any value in the IETF 'denyLowPriority' enumeration - it will be present for extremently short time when the high proirity port kicks the low proirty port off and then will never appear again. The PSE will then go into a continuious cycle of the enumerations 'diabled'/'seraching' as it steps throught the states I have described above. I therfore do think this additional enuerationn is of any help. I however do think the IETF should add the counter I have suggested above. I will comment on this myself.

*Comment Type* **T** *Comment Status* **A** *sm*

Unfortunatly we still seem to have a disconnect between the state machine and this MIB attribute no doubt due to the last set of editing to both items at the last revision.

In addition I propose the following:

1. State to enumeration mapping.
Rather than try and list all the states that map to a particular enumeration it looks like a number of enemerations can be simply based on the entry to certain states. I have prosed the changes below but don't belei they break the previous intent of the state to enuermation mapping. Note that I use the term intent as again I belive this mapping is broken by the additon of DETECTION_TEST state in the last draft which isnt list in the enumeration mapping.

*SuggestedRemedy*

Charter an AdHoc to produce a set of chages to the State Machine (if necessary) and to this attribute and to make sure they match. Have this presented at the closing meeting for approval or, if necesaary, charter the group to agree on this after the meeting.

Specific changes are:

1. State to enumeration mapping.
Change the text 'The enumeration "searching" indicates that the PSE State diagram is in the state DETECTION, CLASSIFICATION, SIGNATURE_INVALID or BACKOFF.' to read 'The enumeration "searching" indicates that the PSE State diagram has transitions into the state START_DETECTION and has not entered another state that maps to an enumeration.'

Law, David 3Com

*Comment Type* **T** *Comment Status* **A** *sm*

The register bits no longer match the Clause 30 MIB since the register includes the addition status 'Detected' and 'Invalid PD detection signature'. Further the register bits do not match the SNMP MIB since the register includes the additional status 'Invalid PD detection signature And of course the Clause 30 MIB doesn't match the SNMP MIB as the SNMP MIB includes 'Detected'.

Note that it is not an issue that the SNMP MIB includes the additional enumeration 'denyLowPriority' since this requires no hardware (register) support.

It should be noted however that the SNMP 'denyLowPriority' enumeration, along with 'Detected' and 'Invalid PD Detected' register values, will be very transient - practically zero time - since they will be instantly overwritten when the state machine transits back through the IDLE state to the START_DETECTION state which will set the enumeration 'searching'.

*SuggestedRemedy*

Need to align at least the register bits with the Clause 30 MIB and if possible get alignment with the SNMP MIB as well.

Suggest that the 'Detected' and 'Invalid PD Detected' values are removed due to their transitory nature.

The final PD register bit was deleted from the last draft so there is now no support from the aPDAdmin attribute and the acPDAdminControl action. The removal of this bit also impacts the related SNMP pethPdPortAdminEnable object.
If the Clause 30 attribute & action and the SNMP MIB object remain these will mandate the same logic the register bit mandated whether the register bit is still present or not.
If this bit was removed because of concerns over the implementation overhead for this bit the Clause 30 attribute and action should also be removed. Since this then makes the oPD Objec empty this object should be deleted and all the related template and Annex 30A text removed
To leave this object in if there was a concern over the implementation impact is to still enforce the same implementation overhead without the advantage of interoperability that the register bit would provide.

*SuggestedRemedy*

Either remove the oPD object and all related text - this seems a major change - or reinstate the register bit and add it to the PD state machine.

I belive there are some concerns with using the word compliance within 802.3 and it is usual t use 'shall' and 'shall not' to define manditory requiremnts to implement and not implement something.

*SuggestedRemedy*

Delete the text 'PDs that implement only Mode A or Mode B are specifically not in compliance with this standard.' since this is covered by the text '... the PD shall be able to operate in at least one of the PD Mode-A columns and in the PD Mode-B column in Table 33-8.' following Table 33-8.

Change the text 'PDs that simultaneously require power from both Mode A and Mode B are specifically not in compliance with this standard.' to read 'A PD shall not simultaneously draw power from both Mode A and Mode B'. Also suggest that this text be moved to the end of the paragraph after Table 33-8, after the text in the first part of the suggest remedy.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change:
PDs that implement only Mode A or Mode B are specifically not in compliance with this standard. PDs that
simultaneously require power from both Mode A and Mode B are specifically not in compliance with this
standard.
To:
Note: PDs that implement only Mode A or Mode B are specifically not allowed by this standard. PDs that simultaneously require power from both Mode A and Mode B are specifically not allowed by this standard.

This subclause states that the Function apply_probes return one of three values, valid, invalid & open_circut and references the PSE detection of PDs subclause 33.2.6. This subclause however only defines two values, valid (33.2.6.1) and invalid (33.2.6.2).
Hence either the PD detection subclause needs to be updated to provide the three possible value or the open_circut value has to be removed from the state machine.

*SuggestedRemedy*

Either update PD detection to provide open_circut value or remove this value from State Diagram.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

The sentence should read: "A function that returns the variable signature as defined in 33.2.6 [valid,invalid] and 33.2.8.1 [open_circuit]"

*Cl* **33** *SC* *P* *L* **#** **141**

Law, David 3Com

*Comment Type* **T** *Comment Status* **A** *sm*

In the definition of the do_classification function a class is always returned yet on examination of the classification function referenced 33.2.7 it can be seen the are cases where the text states in shall statements that the classification should lead to disconnecting the port - Table 33-5 Note 8 - or not powering the PD - subclause 33.2.7.3 1st paragraph, last sentence. There is however no option to provide anything other than a class in return to the do_classification function. The function will therefore need to be updated to return another value that will result in power being denied. The state machine will also have to be changed to take account of this new value.

*SuggestedRemedy*

Update the function to return another value reporting that power should be denied and the state machine needs to be changed to take account of this value.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

The definition of the PSE Enable bit states 'The PSE function shall be disabled by setting bit 11.0 to logic zero. When the PSE function is disabled by this bit, the MDI shall function as it would if it had no PSE function.'. Hence setting this bit when, for example, a PD is being powered should result in the Power being removed and the state machine moving back to the IDLE state. Unfortunately that does not happen at present as the mr_pse_enable variable is only checked on exit from the IDLE state an while this will ensure the PSE will not start once i the IDLE state the PSE will not go to the IDLE state if in any other state.

*SuggestedRemedy*

Add the condition '+ (mr_pse_enable = false)' to the open arrow entry condition into the IDLE state. Remove the (mr_pse_enable = true) * condition from the exit from the IDLE state.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

The function of the previous mr_pse_enable is now an enumeration. The enumeration of "disable" will force and hold the state diagram in the idle state.

Law, David 3Com

*Comment Type* **E** *Comment Status* **A**

The first sentence of this subclause states that the clause defines '... an optional power (non-data) entity ...' however doesn't the Clause actually define two, the PSE and the PD. In addition, suggest it is stated that this Clause specifies the functional and electrical characteristics and remove the reference to 'existing' PHY Clauses as this will not make sens once Clause 33 is published as part of a combined document.

*SuggestedRemedy*

Suggest the text 'This clause defines an optional power (non-data) entity for use with existing physical layers as defined in Clauses 14, 25 and 40.' is changed to read 'This clause defines the functional and electrical characteristics of two optional power (non-data) entities for use with the physical layers defined in Clauses 14, 25 and 40.'. Alternativly if a refence to the two entities is prefered change the sentance to read 'This clause defines the functional and electrical characteristics of two optional power (non-data) entities, a Powered Device (PD) and Power Sourcing Equipment (PSE), for use with the physical layers defined in Clauses 14, 25 and 40.'.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

This clause defines the functional and electrical characteristics of two optional power (non-data) entities, a Powered Device (PD) and Power Sourcing Equipment (PSE), for use with the physical layers defined in Clauses 14, 25 and 40. These entities allow devices to supply/draw power using the same generic cabling as that used for data transmission.

See #317

*Cl* **33** *SC* **33.1** *P* **36** *L* **9** # **154**
Law, David 3Com

*Comment Type* **E** *Comment Status* **A**

Not sure what the statement 'This clause is optional only in the sense that systems may or may not employ powering via the MDI.' in the third sentence of this subclause is trying to say. Implementation of any Clause within IEEE Std. 802.3 is optional and this is covered by the boilerplate statement at the front of IEEE standards which states 'Use of an IEEE Standard is wholly voluntary.'. As for the requirement that if the option to implement this Clause is made then it must conform to this standard then this is covered by the Compatibility Considerations statement.

*SuggestedRemedy*

Remove third sentence.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

The offending sentence has been removed.

*Cl* **33** *SC* **33.1** *P* **36** *L* **10** # **155**

Law, David 3Com

*Comment Type* **E** *Comment Status* **A** *eze*

The Compatibility Considerations text in the fourth and fifth sentences should be promoted to be a separate subclause as is similar text in 14.1.3.2 & 15.1.3.2 for example. In addition reference to compatibility at the 'twisted-pair link' and the 'MDI' seems to be a copy and paste from 10BASE-T and not relevant here. A better subclause to copy would be 15.1.3.2 with MDI modified to be PI.

*SuggestedRemedy*

Delete the text 'All implementations of the twisted-pair link shall be compatible at the MDI. Designers are free to implement circuitry within the PD and PSE (in an application-dependent man-ner) provided the MDI specifications are met.' from subclause.
Insert subclause 33.1.3 as follows and renumber remaining subclauses as required.
'33.1.3 Compatibility Considerations
All implementations of PD and PSE systems shall be compatible at their respective PIs when used in accordance with the restrictions of Clause 33 where appropriate. Designers are free to implement circuitry within the PD and PSE in an application-dependent manner provided that the respective PI specifications are satisfied.'

*Proposed Response* *Response Status* **C**

ACCEPT.

*Comment Type* **T** *Comment Status* **A**

Since the MDI is illustrated in Figures 33-1 to 33-3 suggest that the PI also be included. In the case of Figure 33-1 and 33-2 the best suggestion I can come up with to replace the annotation MDI with is MDI/PI.

*SuggestedRemedy*

1. Change MDI to MDI/PI in figures 33-1 & 33-2.
2. Annotate the PI in Figure 33-3.
3. Add the expansion for PI to Figures 33-1 to 33-3.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

Solved by modifications of Figures 33-1, 33-2 and 33-3. File "ArchDwgsDTE-Pwr.pdf' from Geoff Thompson show the changes required.

Add 'PD = Powered Device', 'PI = Power Interface' , 'PSE = Power Sourcing Equipment' to the annotations.

This comment refers to Item 4 of Table 33-6.

The 350 mW minimum power output requirement is overly burdensome on the vast majority of applications. By placing such a high power requirement, the application of this standard to wall transformer replacements will be seriously impeded. The IEEE will be encouraging implementer to ignore portions of the standard in order to not be wasteful and design PSEs with over capacity. The result will be that either implementers will not be successful in the market or will willfully vary from the spec which will in turn cause 802.3af to be either unsuccessful or irrelevant in many markets.

*SuggestedRemedy*

Suggest that the limit be changed to "350 mA or the rated output of the PSE supply; which ever is less."

*Proposed Response* *Response Status* **U**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

apply_probes is a function, not a boolean variable so assignments of apply_probes<=true anc apply_probes<=false are not valid.
Also, apply_probes_done is not a defined variable or function.
The same comments apply to do_classification

*SuggestedRemedy*

In START_DETECTION, just use "apply_probes" to run the function.
Define apply_probes_done as a boolean indicating that the apply_probes function has completed.
Delete the apply_probes assignment from DETECT_EVAL as you don't need to do anything to disable a function once it is completed.
Do similar changes for do_classification.
To be kind to the reader, please also add signature, pd_requested_power and mr_pd_class_detected to the list of variables. They can have simple definitions such as "Contains the result of the apply_probes function."

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

Specific instructions in comment 286, 287

*Cl* **33** *SC* **33.2.3.5** *P* **43** *L* **18** # **184**

Thaler, Pat — Agilent Technologies

*Comment Type* **T** *Comment Status* **A** *sm*

Why does the exit from DETECT_EVAL include ttot_timer_done+tdet_timer_done rather than just tdet_timer_done? The timers were started at the same time and ttot_timer will be less than tdet_timer so it shouldn't need to be tested here.
More importantly, shouldn't these exit from START_DETECTION because if the detection is taking excessive time the state machine could be stuck in START_DETECTION and not make it to DETECT_EVAL?

This comment also applies to the START_CLASSIFICATION and CLASSIFICATION_EVAL states. Exceeding tpdc timer should cause an exit from START_CLASSIFICATION. tdet plus tpdc is much less than ttot so there is no reason to test for time exceeding ttot.

*SuggestedRemedy*

Please clarify or change.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

Remove Ttot from the state machine and for that matter from the entire standard.
Insert Tpon_timer to begin after completion of detection.
Stike Ttot on lines 17 & 32
Replace Ttot on line 41 with Tpon
Timer Tdet will be "timed out" from the start_detection state.
Apply_probes function will be renamed as DO_DETECTION and return a "done" signal which is called and not assigned a value.
The state "Detect_Eval" will be rename "Detect_Done" and it will start Tpon_timer
Remove "and optional classification" from note 16 on page 54 line 14

*Cl* **33** *SC* **33.2.3.5** *P* **43** *L* **31** # **185**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

On the left hand exit from CLASSIFICATION_EVAL, use a less than or equal symbol rather than <= because the latter looks too much like our assignment symbol.

*SuggestedRemedy*

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

On the left hand exit from CLASSIFICATION_EVAL, use a less than or equal symbol rather than <= because the latter looks too much like our assignment symbol.

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

On the right hand exit from DETECT_EVAL, you are testing pd_requested_power, but you haven't assigned a value to it.

*SuggestedRemedy*

Assign a value to pd_requested_power in START_DETECTION.

By the way, I don't understand why you need two variables - one for all the possible power levels and one with a condensed set. It would be simpler to just have one variable.

*Proposed Response* *Response Status* **U**

ACCEPT.

*Cl* **33** *SC* **33.2.3.5** *P* **43** *L* **26** # **187**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

When mr_pse_alternative is B and the signature was open_circuit, both exit conditions from SIGNATURE_INVALID will be true.

Also, the exit conditions from DETECT_EVAL and CLASSIFICATION_EVAL that are not qualified by the timers can be true at the same time as the exit to IDLE if a timer has expired.

*SuggestedRemedy*

Replace the left-hand exit of SIGNATURE_INVALID with
(mr_pse_alternative=B)*(signature != open_ciruit)

The problem for the other states could be resolved by moving the exit on timeout to START_DETECTION AND START_CLASSIFICATION as suggested in other comments. If this is not done, then "*!xxx_timer_done" should be added to each transition that isn't to be taken when the xxx timer has expired.

"!=" above is meant to represent the not equals symbol which is what should be used in the draft.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

Accept the first suggested remedy. For Signature_Invalid as is.
Add an exit condition from "Start_detection" which transitions on tdet_timer_done
Remove tdet_timer_done from the equiation starting on line 17
Add an exit condition from Start_Classification which transitions on tpdc_timer_done
Remove tpdc_timer_done from equation starting on line 32

*Cl* **33** *SC* **33.2.3.5** *P* **43** *L* **49** # **188**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

The POWER_OFF state is unnecessary and inconsistantly used.

It is unnecessary since the action taken is the same as in the IDLE state and the IDLE state requires power_applied to be false before it is exited.
It is inconsistantly used since the actions causing the global transition to IDLE can go directly from POWER_ON to IDLE. (Actually, error_condition should go true due to the faults that cause transition to POWER_OFF and the global transition will override the transition to POWER_OFF.) Also, mr_detection_test could go true as power_applied is going true and one might transition to POWER_OFF or to IDLE

*SuggestedRemedy*

Remove the POWER_OFF state.

If there is some reason it is needed, then the right-hand exit from POWER_UP and the global transition to IDLE should go to POWER_OFF state rather than IDLE so that the state is always used. In that case, power_applied=false doesn't need to be tested to leave IDLE.

*Proposed Response* *Response Status* **U**

ACCEPT.

*Cl* **33** *SC* **33.2.3.5** *P* **44** *L* **8** # **189**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

mr_overload has values assigned by the state machines, but it is not defined in the variables list and it is never used.
mr_overcurrent is defined in the variables and used by management (33.6.1.3) values are never assigned to it.
Perhaps they are suppose to be the same variable, but in that case the behavior is not consistant with 30.9.1.1.8's description of overCurrent.
30.9.1.1.8 indicates that overcurrent is detected when the current exceeds the current limit for the Overload time limit and says the overcurrent condition maps to the overcurrent bit.
However, mr_overload goes true when current limits are exceed regardless of time duration.

Also note that when Ilim > I > Icut, DETECT_OVERLOAD will be assigning TRUE to mr_overload at the same time MONITOR_SHORT is assigning FALSE to it. What is its value?

*SuggestedRemedy*

Delete all occurances of mr_overload. Add a state to the overload and short detection state machines. On tovld_timer_done or tlim_timer_done, respectively, transition to the new state and set mr_overcurrent<=TRUE.
There does not need to be an exit from the new state as the normal exit would be via the global transition to IDLE_OVLD or IDLE_SHORT when power_applied=FALSE. In one of the idle states or in MONITOR_OVLD state set mr_overcurrent to FALSE. It doesn't need to be done in both idle states because both machines will be in idle at the same time. Putting the assignment in MONITOR_OVLD rather than an idle state would preserve the overload indication during idle.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

Remove "Overcurrent" from 30.9.1.1.8
Add new sticky status bit 12.9 for short circuit.
Make 12.8 a sticky status bit.
Fix 30.9.1.1.10 to count 12.9 + 12.8
Figure 33-6 middle monitor change to use mr_short
Define mr_overload and mr_short in variables.

*Cl* **33** *SC* **33.2.3.5** *P* **43** *L* **46** # **190**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

There could be a failure in a PD that doesn't effect the voltage it presents during probing but does draw excessive current when powered. If there is such a failure, this state machine will continuously cycle turning power on, timing out the overload and turning power off. If the PSE has a short detection and turnon time, this may result in too much power into the short. When a short or overcurrent is detected, there should be an enforced time in the power off to limit the duty cycle at which power is applied.

*SuggestedRemedy*

When tlim_timer_done or tovld_timer_done occurs, go to the BACKOFF state rather than power on.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

We will create a new state called "ERROR_DELAY" which will be entered when tlim_timer_done or tolvd_timer_done become true from the POWER_ON state. The exit condition will be the expiration of a timer Ted_timer_done is true. A value for Ted must be added to table 33-6 which will be 2 seconds long.

*Cl* **33** *SC* **33.2.3.5** *P* **43** *L* **41** # **191**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

Be more specific about the definition of power_applied. Does it go true when the power supply has reached the proper output voltage or current? If it is based on the output voltage, there is a possible problem:
If power is applied and the PD draws excessive current (more then Ilim or Icut), the overload current can be drawn until ttot_timer expires because the tlim and tovld timers are not enabled during POWER_UP.

*SuggestedRemedy*

Add a clear definition of the criteria for assertion of power_applied
If over load during POWER UP is a concern, there are several alternatives:
One way would be to use pi_powered rather than power_applied in the short detecting state machine and add an exit from POWER_UP to BACKOFF if the tlim timer expires. This assumes that one is willing to have current over Icut but under Ilim during power up.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

Replace power_applied with pi_powered as the exit condition for the pse monitor state machines idle state.

*Cl* **33** *SC* **33.2.3.5** *P* **44** *L* **20** # **192**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **R**

There doesn't seem to be any purpose having both the short and overload detection state machines.
Tlim and Tovld both have the same range so when I > Ilim, both tovld_timer_done will be asserted within the timer range for tlim_timer_done assertion.

There would be a point to having two timers if the time limit for a short was significantly less than the time limit for a more mild overcurrent condition.

*SuggestedRemedy*

Either remove the tlim and its associated state machine or make Tlim significantly shorter thai Tovld.

*Proposed Response* *Response Status* **U**

REJECT.

The two timers share the same range, but the expectation of the committee is that in practice the values will be one of two conditions in actual implementations:
1) The implementer will use a significantly shortened time for the short circuit than the overload, or
2) The implementer will actually only run a single timer and will in fact run only a single statemachine.
By choosing overlapping times, either of these implementation can be achieved. The overload variable is being replace with a separate variable for over_current and short_circuit which are then ORed \together to provide a single sticky register bit to flag over current events

*Cl* **33** *SC* **33.2.4** *P* **44** *L* **33** # **193**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

The content of this paragraph conflicts with the operation shown in the state machine because the state machine exits the idle state whenever power is not applied and the pse is enabled. I 802.3, the state machines have precedence.

*SuggestedRemedy*

Add a variable to the transition from IDLE to START_DETECTION such as ready_to_detect which the PSE may assert in an implementation dependent fashion when it is ready to probe the link segment.

*Proposed Response* *Response Status* **U**

ACCEPT.

Thaler, Pat — Agilent Technologies

*Comment Type* **T** *Comment Status* **A**

Why do the current and voltage methods handle out of range and ambiguous values differently?
Ambiguous:
Table 33-4 indicates that measured Iclass between to class values (e.g. >5 mA and <8 mA) may be classified as either of the adjacent classifications. On the other hand, the fourth sentence of 33.2.7.3 says that a voltage measurement between 15 V and 20 V causes the PD to be not powered or powered as Class 0.
Out of range:
The measured current method requires that the device not be powered if the current is too high but the measured voltage method allows the PSE to choose between not powering or assuming class 0 when the voltage at the highest current range is too low.

*SuggestedRemedy*

These should be equivalent conditions so both methods should treat them the same.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

This comment is no longer applicable because the forced current classification method has been removed from the draft (see comment #44).

This requires that the PSE not supply power if it can't do so within Tpon. This is inconsistent with the state machine which checks that Ttot is not exceeded but does not check Tpon. If detection and classification take less then the maximum allowed to them (or if classification is not done), then the state machine will allow application of power after Tpon has expired.

*SuggestedRemedy*

Either change this text to match the state machine (that is, require that power not be applied it it cannot be applied within Ttot time after detection has started) or change the state machine to match the text (add a timer for Tpon which is started when POWER_UP state is entered and tested while in that state).

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

Ttot has been remove and Tpon has been added to time from the Detect_Eval state.
Ttot will be expunged from the document.

*Comment Type* **T** *Comment Status* **R** *sm*

Normally we allow for a tolerance in state machine timers. A number of the timers here (e.g. tbdo, tdet, ttot) do not have tolerences - they reference a table that has a fixed value for them. Add a tolerence. A fairly wide tolerence should be allowed if possible as it simplifies implementation of slow counters.

Also tpdc has a very broad range in Table 33-6 (from 10 to 75 ms). It isn't clear why it is so broad.

*SuggestedRemedy*

*Proposed Response* *Response Status* **C**

REJECT.

The committee has preferred to provide windows for all value instead of a single number and tolerance bands around that such a number. We believe we have created windows that are generally very broad. As we have set windows (or ranges) there is no need for tolerances on the endpoints as the requirements is to be between the endpoints. Tpdc was specified to be fairly wide as the designs to implement the timer are expected to range from RC circuits to 25MHz counter, to simply all implementations without burdening unnecessarily we have used a wide window.

Thaler, Pat — Agilent Technologies

*Comment Type* **T** *Comment Status* **A**

Delete the sentence "During this detection backoff, the PSE is exempted from the overall Ttot ...." as it is meaningless
Ttot is specified as the time from beginning of detection to finishing the applicaiton of power. During backoff, detection has not yet begun so of course Ttot does not apply just as it does not apply when the PSE is not doing detection due to implementation dependent considerations.

*SuggestedRemedy*

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

This comment is no longer applicable. An overhaul of the state machine has removed the variable Ttot.

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **R**

I had made a comment on the working group draft regarding polarity insensitivity and compatability when the PSE or PD is Auto-MDI-X sensing. The resolution agreed to seems to be only partly implemented.
An MDI PD does not need to be polarity insensitive because it can only interoperate with an MDI-X or Auto-MDI-X PSE and either will provide it with the polarity it expects.
An MDI-X PD might interoperate (with regards to Ethernet signal compatability) with an Auto-MDI-X PSE, but the polarity provided will be the opposite of what it expects unless it is polarity insensitive. This is the same as the situation for an Auto-MDI-X PD. Therefore, it also needs to be required to support polarity insensitivity.

*SuggestedRemedy*

Either change the last sentence to
A PD with an MDI-X or Auto-MDI-X interface shall be polarity insensitive.

or delete that sentence and change page 57 lines 49-51 to
"A may be implemented to be insensitive to the polarity of the power supply. A PD with an MDI shall be able to operate in at least the PD Mode-A MDI column and in the PD Mode-B column in Table 33-8. A PD with an MDI-X or Auto-MDI-X interface shall be able to operate in all the columns of Table 33-8."

*Proposed Response* *Response Status* **U**

REJECT.

With the resolution of comment #77, there is no wiring configuration where a PD will be powered but will not align data. Therefore, the requested change is unnecessary and overly burdensome on some applications.

The draft states: 5
"For a PD to be a valid Class 0 load, the only requirement is that the PD implement a signature V-I slope."
This allows a PD that doesn't provide classification to be totally unconstrained in the classification signature it provides, but the PSE has no way to know that it is attached to such a PD. Therefore, if the PSE performs classification, it may get a result indicating that the PD is in a class using less power than it actually uses or it may get a result that is an invalid value. I the latter occurs, it is possible that the PD may not get powered.

*SuggestedRemedy*

Require that a PD input provide a conditions that fall within the Class 0 signature if it does not support classification.

*Proposed Response* *Response Status* **U**

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A**

Why is the PD allowed to oscillate when tested with the higher of the two test currents for its class. If it is oscillating, the measured voltage could be below 21 volts and the classification would fail. Also, there is no requirement that the PSE begin testing with lower currents and move on to testing higher currents so oscillation at higher current levels could cause a false classification.

*SuggestedRemedy*

Require that the PD not oscillate when tested at the higher current level for its class or at leas require that any oscillations remain above 21 volts.

Also, either require that a PSE performing measured voltage classification moves from lower currents to higher currents or require that any oscillations at currents for higher classes remai above 21 volts.

re: "shall ... turn off at voltages > 30 V when it is fed by a 44 V-57 V source connected through a 20 ohm series resistor.

This is a meaningless and untestable requirement as a voltage less than 30 volts should not occur when the PD is fed by a 44 V or higher source connected through a 20 ohm series resistor.

*SuggestedRemedy*

Perhaps it should be when the input voltage dorps below 30 volts when fed through a source connected through a 20 ohm series resistor - to do the test the source voltage is reduced until the input voltage drops below 30 volts.

Furthermore, it should be the PD power supply because the powered device may have an alternate power source and may continue to operate.

Also, either use the proper less than or equals and greater than or equals symbols or use just < and >. I prefer the latter for analog measurements.

Part of the broad market potential argument for DTE power was based on powering Ethernet interfaces for items such as light controllers and various sensors(an example given was the lights and sensors at Disney World). In many instances such devices would be outside a singl building environment. Therefore, the statement that "such requirements are beyond the scope of this standard" and the recommendation that such situations be handled by the use of non-electrically conducting link segments (which don't provide DTE power) is inconsistant with the intent of the 802.3af project.

*SuggestedRemedy*

Historically, the repeater specifications from which this was copied was written before 10BASE-T and the MAUs at the time were required to provide 500 V isolation. When 10BASE-T was added, we used isolation levels (the same as those in 33.4.1) that were the same as those required for connection to external phone lines because 10BASE-T connections could be in a wiring closet with phone lines and be accidentally connected to an external line. These isolation levels assume that there is surge suppression at the building entry and are intended to handle the residual of surge that gets through the surge suppressio device.

Remove the statement "It is recommended ..." and provide reference to at least one safety standard that would supply requirements for the additional protection.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

In 33.4.1.1.2 , page 66, line 7:

"Protection requirements for such hazards are beyond the scope of this standard. Guidance on these requirements may be found in IEC 60950-1, Section 6 Connection to telecommunication networks, as well as any local and national codes related to safety."

Delete this sentence: It is recommended that the above situation be handled by the use of a non-electrically conducting link seg-ment (see Clause 15, 26 or 38).

The meaning of this sentence, especially "reflect" is unclear. Also, a Midspan PSE must provide continuity for the signal pairs. If it doesn't, the link will not work.

Also, it is possible that one PHY connected has a PD and and one does not. The device that does not have a PD might be adversely affected by the power applied to those pairs for the PD as there are no requirements for non-PD PHYs to tolerate such voltage. The detection or classification signature of the PD might be altered by the presence of the non-PD so that detection or classification would fail.

Therefore, to ensure operation for PDs and to protect non-PD devices, a midspan PSE should be required to not provide continuity for the spare pairs.

*SuggestedRemedy*

A Midspan PSE inserted into a channel shall provide continuity for the signal pairs. A Midspan PSE shall not provide continuity between the two sides of the segment for the pairs on which it injects power.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

A Midspan PSE inserted into a channel shall provide continuity for the signal pairs. A Midspan PSE shall not provide DC continuity between the two sides of the segment for the pairs which inject power.

Thaler, Pat — Agilent Technologies

*Comment Type* **TR** *Comment Status* **A** *sm*

Some of the bits defined only apply to the PSE and there is no statement of what the PD will do with those bits.

Also, some bits that apply to both are described from the point of view of a PSE.

*SuggestedRemedy*

For each item that does not apply to a PD, state that the PD shall return 0.

For PD Class "a PSE shall report PD Class of the detected PD and a PD shall report its PD Class as specified.... For a PSE, the value in this register is valid ...."

A PD should have bits to report that it is in the MDI powered state (for those PDs that have an alternate power source).

An alternative solution would be to not specify this register as applying to the PD because the information available is fairly limited and in the common case where the PD does not have alternate power the value of this register is very limited - the PD has power and you can read its class or the PD has no power and you can't read any registers.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

This has been handled by changes to the State Machine.

There are no bits for the PD.

Law, David 3Com

*Comment Type* **T** *Comment Status* **A**

In all Notes to this table the text 'the PSE must' appears which seems to be a misuse of the word must. To quote the IEEE Style Guide [http://standards.ieee.org/guides/style/2000Style.pdf] 'The use of he word must is deprecated and shall not be used when stating mandatory requirements; must is used only to describe unavoidable situations.' In addition a mandatory requirement shouldn't really be stated in a note to a table. At a minimum the word 'must' should be replaced with 'shall'; in each of these notes as they seem to be mandatory requirements. Further, suggest that the text from these notes be moved to, and incorporated into, subclause 33.2.6.
In addition Items 7, 8 and 9 in Table 33-2 use the word 'must' in their names. While in this case it is indeed just the parameter name and not in violation of the style guide consider removing or replacing must in these parameter names.

*SuggestedRemedy*

Change the word 'must' to shall in each of the Table 33-2 notes.
Incorporate the text of the notes into subclause 33.2.6.
Consider removing or replacing the word 'must' in the parameter names of Items 7, 8 & 9.

Isn't the conformance test point for all these measurements the PI. This subclauses, and its subclauses, refers to performing measurements at the port, powering pairs and to the link segment. In another comment I have suggested that 'port' should be 'PI' but what about the term 'link segment'.
From the definitions earlier on in the draft it would appear that where 'link segment' is used it should at least be replaced with 'link section' otherwise these requirements would be restricte to Endpoint PSEs and would not apply to Midspan PSEs - a Midspan PSE can only be connected to a link section. This doesn't seem to be correct.
Furthermore, don't all these measurement requirements still stand even if there PSE PI being probed is unconnected. For example the text in subclause 33.2.6.2 states that 'The PSE shall reject link segments as having an invalid signature ...' but shouldn't it reject as having an invalid signature anything that matches the rejection criteria regardless if it is a link segment (should be section) or not.

*SuggestedRemedy*

Examine the cases where terms such as 'The PSE shall reject link segments' to see if they are appropriate and replace with terminology referring to the PSE PI instead if appropriate. Perform a global search, and if necessary, replace of the term 'link segment' with the term 'link section'.

*Comment Type* **T** *Comment Status* **A**

The requirements for the bands between Rgood and Rbad are clearly defined in Note 8 however what if a PSE measures a signature that has resistance that meets Rgood and capacitance that meets Csig but a voltage offset that exceeds Vos. Is it intended to be implementation dependent whether this is accepted as a valid signature or not. If so, there should be some text stating that if the signature doesn't meet the requirements of either the Detection criteria nor the Rejection criteria then the decision to report the signature as valid or invalid is undefined but one of the two values shall be returned.

*SuggestedRemedy*

Suggest text clarifying the action on any signature that does not meet either the Detection criteria nor the Rejection criteria be added. I may need to be made clear that a value of ether valid or invalid has to be returned to the state machine.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

Add a paragraph below c in the rejection criteria:

In instances where the resistance and the capacitance meet the detection criteria but one or both of the offset tolerances are exceeded, the detection behavior of the PSE is undefined.

In table 33-2 change "accept signature impedance" to "accept signature resistance", "reject signature impedance" to "reject signature resistance"

in section 33.2.6.1 change
"A PSE shall accept as a valid signature a link segment with all of the following characteristics between the powering pairs, as specified in Table 33-2:
a) resistance R good ,
b) signature capacitance tolerance C sig ,
c) signature offset voltage tolerance V os , and
d) signature offset current tolerance I os ."

to

"A PSE shall accept as a valid signature a link segment with both of the following characteristics between the powering pair with offset voltage tolerance Vos and offset current tolerance Ios, as specified in Table 33-2:
a) resistance R good and
b) capacitance C good"

*Cl* **33** *SC* **33.2.7.1** *P* **49** *L* **8** # **231**

Law, David 3Com

*Comment Type* **E** *Comment Status* **A**

This subclause seems to be a PD rather than PSE related subclause. In addition the first paragraph seems to be trying to give an overview of PD Classes however that is already provided in the first paragraph of subclause 33.2.7. Table 33-2 is a duplicate of Table 33-11 except for the addition of column four - and it would seem a bad idea from a draft, and further standards, maintenance point of view to duplicate such information.

*SuggestedRemedy*

Suggest that Tables 33-3 and 33-11 are somehow merged to avoid the duplication of information Also consider deleting subclause 33.2.7.1 and placing the duplicate text in the surrounding subclauses.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

Delete column 4.

Change note to: This is the maximum power at the PSE PI. For maximum power available to PDs, see Table 33-10.

Law, David 3Com

*Comment Type* **T** *Comment Status* **A**

Rgood is defined as 19K min and 26.5K max and Rbad is defined as 15K min and 33K max. Hence a value of say 22K could be read as being within the range of both values hence meeting the requirems of both the Detection criteria 33.2.6.1 a) resitance Rgood and the Rejection criteria 33.2.6.2 a) Rbad. Clearly this is not correct and this seems to be due to the Rejection criteria 33.2.6.2 '... the following characteristics between the powering pairs ... resistance Rbad' actaully meaning a resitance less than Rbad min and greater than Rbad max. This however isn't the normall use of a min max specification in a Table and is therfore slighlty confusing. A note to Table 33-2 starts to clarify this (note 8) but this note does not include a shall statement wheras 33.2.6.2 a) does so this still could be open to some interpretation from a standards point of view.

*SuggestedRemedy*

Suggest that text
'a) resistance Rbad' or
'b) capacitance Cbad'
should be changed to
'a) resistance less than Rbad min' or
'b) resistance greater than Rbad max' or
'c) capacitance Cbad'

Law, David 3Com

*Comment Type* **T** *Comment Status* **A** *sm*

There is a very weak link between the text and the state diagram. While this is understandabl due to the state diagram having been added after much of the text was written we should make sure any discrepancies are fixed as in the case of conflict the state diagram will overrid the text.
Please note that 100% support having the State Diagrams - this is not a criticism of them - it just where we are due to the evolution of this document.

*SuggestedRemedy*

Consider the following:

Add a cross reference to 33.2.4 in the apply_probes function
Rename 33.2.4 to be 'PD detection function' and 33.2.5 and 33.2.6 and their subclauses, subclauses of 33.2.4.
Consider renaming the apply_probes functiontion to be the do_detection function.

Add a cross refernce to 33.2.7 in the do_classification function
Remname 33.2.7 the be the PD Classifiction function.

Move 33.2.8 and 33.2.8.1 to be an introduction and overview of the State Diagram and its operation. At a minimum the two descriptions should match.

Remane 33.2.9 Power Supply Function.

Consider adding a diagram to show the vairaibles that are passed between these functions and the state diagram. That can be supplied.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

Move page 47, line 40 to top of detect section page 44 line 42
Move 33.2.8 per instructions.
We will not add the word "Function" to the section titles, and will attempt to limit the term "function" to only the appropriate sections of the state machine.

*Comment Type* **TR** *Comment Status* **A** *sm*

There is a serious mismatch between clause 30 and 33 on control and status of the PD. There are also internal inconsistencies within 33 between the PD state diagram and the MDIC registers. There are currently no PD control bits defined, so there is no need for this object (o the corresponding definitions in 30A). I don't recall if the PD control bit was lost in splitting the control and status of earlier MDIO register definitions, or was a concious but incompletely implemented choice. (The old "Power Enable" bit is now specified as "PSE Enable".

*SuggestedRemedy*

I recommend defining a "PD Enable" bit and mapping the aPDAdminState attribute to it (fix name and reference on page 187 line 2 accordingly).

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

This is being changed by the management AdHoc. The current plan is to remove any mandatory elements of PD management.

Grow, Robert Intel

*Comment Type* **TR** *Comment Status* **A**

The figure is confusing with regards to 33.2.1. Subclause 33.2.1 describes an MDI equivalent with all eight signals defined. The PD and PSE in Figure 33-3 violate that description in that it shows an MDI with only 2 pairs at the PHY.

*SuggestedRemedy*

Change figure to illustrate handling of unused pairs between PSE and MDI. I believe a mid-span PSE could be a cross connect (close to what is illustrated), between two eight-pin modular connectors, etc. Add of a cross-connect to the PSE cable interface, and changing title of Figure 33-4 to only refer to endpoint PSE. Add to the end of page 40 line 10: "and use the eight pin modular jack illustrated in Figure 33-4." Add to paragraph on page 40 line 15: "Midspan PSEs may use eight pin modular connectors or another cross connect technology compatible with the channel specification of this clause."

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

The state diagrams do not take advantage of the definitions of 21.5, nor are they consistent. Variables do not need to be tested against TRUE or FALSE if they are defined as having these boolean values. The state diagrams also use lower case "true" and "false" which is not consistent with conventions.

*SuggestedRemedy*

In Figures 33-5, 33-6, 33-13, delete all instances of "= true", and for all instances of "="false" precede the variable name with "!" and delete "false". Where an assignment is made, replace "true" with "TRUE" and "false" with "FALSE".

*Proposed Response* *Response Status* **C**

*Comment Type* **E** *Comment Status* **A**

The reference should be one more level down, though the usage of Table 33-19 is in my opinion undesirable. It is an unnecessary level of indirection, and is ambiguous in its interpretation for at least two variables (ambiguity is reflected in differing variable treatment in the state diagram).

*SuggestedRemedy*

Preferred: remove the table (details in another comment).
Alternate: move 33.6.1.3 to become 33.2.3.5 and modify the sentence with the cross reference.
At a minimum: change cross reference to 33.6.1.3

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

change cross reference to 33.6.1.3

*Cl* **33** *SC* **33.2.3.2** *P* **40** *L* **37** **#** **286**

Grow, Robert Intel

*Comment Type* **TR** *Comment Status* **A** *sm*

The definitions of MDIO control bits and the variable definitions for the PSE state diagram are ambiguous and unless changed will allow inconsistent behavior to management. Further ambiguity is added because the variable descriptions do not use consistent terms: controls (e.g., mr_detection_test), signals (e.g., mr_overcurrent), variables (e.g., mr_pse_alternative), condition (e.g., power_on), not identified with any of these terms (e.g., mr_mps_valid) and even not defined as variables (e.g., mr_pd_class_detected). Clarity would be helped significantly if Table 33-19 were eliminated and mapping was described precisely in the definitions here. (Clause 37 does a much better job at this than does clause 46, which I believe was the starting point for this diagram.)

*SuggestedRemedy*

"error_condition
A signal indicating the status of the mandatory . . . "
"mr_detection _test
. . . been detected. This control is equal to Detection Test Control (bit 11.4) and not PSE Enable (bit 11.0) and not PSE Force Power Test Control (bit 11.1)."
"mr_mps_valid
The PSE must monitor either the DC or AC Maintain Power Signature (MPS, see 33.2.11). This signal indicates the presence or absence of a valid MPS. This signal is the negation of MPS Absent (bit 12.7). . . ."
"mr_overcurrent
. . . condition. This signal maps to the Overcurrent status (bit 12.8)."
"mr_pse_alternative
. . . (see Table 33-1). This variable is a derived from Power Control (bits 11.3:2)."
"mr_pse_enable
A control that enables PSE operation per PSE Enable (bit 11.0)."
"mr_pse_force_power
. . . This control is equal to Force Power Test Control (bit 11.1) and not PSE Enable (bit 11.0)."

To make detection test and force power test mutually exclusive, change the definition of bit 11.4 (p. 75, l. 41) to read "When bit 11.0 is '1' or bit 11.1 is '1', bit 11.4 is ignored. When bit 11.0 is '0' and bit 11.1 is '0', then . . ."

With the above definitions, the following state diagrams simplifications can be made: Universal entry into TEST_MODE becomes a transition from IDLE with the condition "mr_pse_force_power * !error_condition". This allows power_on, pse_reset and error_condition force transition to IDLE without from all states, and the negated terms enablin transition out of IDLE.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

"error condition
A signal - - - Accept
"mr_detection_test - - N/A
"mr_mps_valid - - Accept
"mr_overcurrent - AIP remove defintinion in the variable section, make the corresponding MII

register bit 12.8 a latching high, clear on read bit that is set when either the DETECT_OVLD state or DETECT_SHORT state is entered. Need to correct the corresponding MIB entry to be a counter. Table 33-19 needs to be corrected accordingly.
"mr_pse_alternative - Accept
"mr_pse_enable .... mr_pse_force_power . . . AIP

Modify Table 33-17 to merge 11.0 & 11.1 to provide the same functionality as described in the text of the current but as a enumerated pair and not two separate bits. Edit 33.6.1.1.5 and 33.6.1.1.4 into a single subclause describing the enumeration. Remove variable definitions fo mr_pse_enable and mr_pse_force_power, and replace with a new enumerated variable that reflects the values in the merged bits 11.0:1 As a result of this change "TEST_MODE" will be entered from the "IDLE" state and not globally entered.

---

*Cl* **33** *SC* **33.2.3.4** *P* **42** *L* **24** **#** **287**

Grow, Robert Intel

*Comment Type* **T** *Comment Status* **A** *sm*

The state diagram uses two signals from these functions (apply_probe_done, do_classification_done) but these signals are not defined. The functions are also treated like variables in the state diagram (admittedly something done in other state diagrams of 802.3) b assigning TRUE and FALSE to them. Either treat the functions like timers (start command and done signal) or at least indicate that they produce a done signal.

*SuggestedRemedy*

Preferred change: Add a sentence at the beginning of this subclause. "All functions are invoked with a start command (e.g., start do_classification) and at completion produce a done signal (e.g., do_classification_done)." Add "apply_probes_done" to START_CLASSIFICATION and SIGNATURE_INVALID exit transitions from DETECT_EVAL. Delete DETECT_EVAL action ("apply_probes <= false"). Change action in START_DETECTION from "apply_probes <= TRUE" to "start apply_probes" and similar changes to do_classification.

Alternate change: Add a sentence at the beginning of this subclause. "All functions at completion produce a done signal (e.g., do_classification_done)."

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

change the diagram function call to match Clause 48, eg DO_CLASSIFICATION and rename the "apply_probes" function and references to it to "DO_DETECTION". Each function will set a "done" signal, which will be specified as the first sentence of the 33.2.3.4 subclause per suggested remedy.

---

*Cl* **33** *SC* **33.2.3.4** *P* **42** *L* **28** **#** **288**

Grow, Robert Intel

*Comment Type* **E** *Comment Status* **X** *eze*

The function definitions include variable definitions. All variables should be defined in the same section (33.2.3.2)

*SuggestedRemedy*

Move definitions of signature, do_classification, and mr_pd_class_detected to the variable section. Add text to describe the variables that the functions set values. Add a reference to the relevant section for the function (do_classification is described in 33.2.7 and apply_probes is described in 33.2.5 and 33.2.6).

*Proposed Response* *Response Status* **Z**

---

*Cl* **33** *SC* **33.2.3.2** *P* **40** *L* **48** **#** **289**

Grow, Robert Intel

*Comment Type* **TR** *Comment Status* **A** *sm*

There is a mismatch between the usage of mr_detection_test, the specification of the Detection Test bit, and the function it is supposed to control. The state diagram does not implement the detection test (it can't exit IDLE unless mr_pse_enable is true, which disables Detection Test). The variable mr_detection _test does not map directly to bit 11.4, it provides equivalent function to that described by bit 11.4.

*SuggestedRemedy*

This will be partially fixed if a more general comment is accepted to eliminate the variable mapping table. The variable mr_detection_test should be a function of bits 11.4 and 11.0. It is false when bit 11.4 = '0' + bit 11.0 = '1', and true when bit 11.0 = '0' * bit 11.4 = '1'.

The IDLE to START_DETECTION transition should be "(mr_pse_enable + mr_detection_test) * !power_applied * !error_condition" to allow detection to progress in the test mode when there are no errors.

The DETECT_EVAL to DETECTION_TEST transition should be (signature = valid) * (!performs_classification + mr_detection_test).

The DETECT_EVAL to START_CLASSIFICATION transition should be (signature = valid) * performs_classification * !mr_detection_test.

*Proposed Response* *Response Status* **U**

ACCEPT IN PRINCIPLE.

Remove the Detection_Test variable and functionality.
Add a sticky register, latching high, to register 12 to indicate "do_detection" function returns "valid".
Add a MIB counter that increments with occurrences of the sticky bit, counter increments at two times per second.

The exisiting text as shown in 1.4.170 is technically incorrect even though it is what appears i the 1998 and 2000 editions. This somehow got screwed up during the many revisions. Note that the original definition came from the 10BASE5 coax clause! (Ref 802.3:1990, 8.1.2). The term MDI is applied to all media interfaces at all speeds (The sole exception is the use of the term FOMDI in 9.9) throughout the standard, it is not specific to twisted pair. (See figs 22-1 and 44-1)

*SuggestedRemedy*

Change to:
1.4.xxx Medium Dependent Interface (MDI): The mechanical and electrical interface between the transmission medium and the MAU (1 or 10 Mb/s) or the PHY (higher speeds) and also any associated (optional per 802.3 clause 33) Powered Device (PD) or endpoint Power Sourcing Equipment (PSE).

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

change editorial instructions to: "delete current 1.4.170 text and insert" suggested remedy tex

*Comment Type* **E** *Comment Status* **A**

Note that the term "Link Section" here is not the same as a "section" as used in clause 50 (the WIS) where "section" is used in the SONET sense. I don't see any problem there but there is likely to be confusion between terms in clause 30.

*SuggestedRemedy*

??

*Proposed Response* *Response Status* **Z**

Withdrawn. Use aligns with section in the coaxial cable sense. See 1.4.74 and uses in claus 10.

*Comment Type* **E** *Comment Status* **A**

The sense of the 1st paragraph is incorrect in that it discusses only one entity where 2 are being specified:

*SuggestedRemedy*

This clause defines optional power (non-data) entities for use with existing physical layers as defined in Clauses 14, 25 and 40. These entities (i.e. PSE and PD) allow devices to supply/draw power using the same generic cabling as that used for data transmission. This clause is optional only in the sense that systems may or may not employ powering via the MDI. All implementations of the twisted-pair link shall be compatible at the MDI. Designers are free to implement circuitry within the PD and PSE (in an application-dependent manner) provided the MDI specifications are met.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

*Comment Type* **E** *Comment Status* **A**

Sentence construction is clumsy and unclear or not true:
"Specifications that are defined at the MDI that is a PI apply to an Endpoint PSE."
..is not quite true because they might apply instead to a PD

*SuggestedRemedy*

Change:
Specifications that are defined at the MDI that is a PI apply to an Endpoint PSE.
to:
PSE power interface specifications that are defined at the MDI apply to an Endpoint PSE.
(and add for clarity if you wish: "They may or may not apply to a Midspan PI.")

*Proposed Response* *Response Status* **C**

ACCEPT.

*Cl* **33** *SC* **33.1.3** *P* **36** *L* **42** # **321**

Thompson, Geoff — Nortel Networks

*Comment Type* **E** *Comment Status* **A**

Page break error. There is plenty of room left on this page (25 lines) for the next figure which requires only about 16 lines.
As a rough estimate it lookls like that with a little graphics editing that all 3 figures could make it onto the lead page. This would be a good thing to do

*SuggestedRemedy*

Change:
Move 1 or possibly 2 of the figures onto the opening page of the clause.

*Proposed Response* *Response Status* **C**

ACCEPT.

This reformatting happened as a result of resolution of comment 156.

*Cl* **33** *SC* **33.2** *P* **38** *L* **38** # **322**

Thompson, Geoff — Nortel Networks

*Comment Type* **E** *Comment Status* **A**

Ed Note: This comment did not have a CommentType assigned by the author. The comment editor assigned it a value of 'E'.

I would propose to change the following text for improved technical accuracy: The PSE's main functions are to search the link segment for a PD, optionally classify the PD, supply power to the link segment only if a PD is detected, monitor the power on the link segment, and remove power from the link segment when a PD is disconnected or no longer requests power.

*SuggestedRemedy*

Propose changing to: The PSE's main functions are to search the link segment for a PD, optionally classify the PD, supply power to the link segment only if a PD is detected, monitor the power on the link segment, and scale power back to the detect level when power is no longer requested or required. (Optional sentence: Disconnection is one instance when power is no longer required.)

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

The PSE's main functions are to search the link segment for a PD, optionally classify the PD, supply power to the link segment only if a PD is detected, monitor the power on the link segment, and scale power back to the detect level when power is no longer requested or required. An unplugged link segment is one instance when power is no longer required.

see #319 - doesn't really apply except that we agreed to change to scale back power elsewhere - Chad

I can find no text much less any prominent text that says that the scope of this document is limited to cabling plants consisting of point-to-point links. There is no warning that the detectic schemes may be compromised or spoofed by cabling plant that is multi-point as opposed to point-to-point links. This warning is necessary because there are ISDN wiring schemes of this sort and they may not be obviously different to end users

*SuggestedRemedy*

Add text during intro portion that indicates the scope is specifically limited to point-to-point link

Add text to warn that it must be assured that only point-to-point links are cabled into PSEs an PDs. Text in the detection portion (33.2.8.1) to this effect would be good also.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

on page 36, line 27 add:
The detection and powering algorithms are likely to be compromised by cabling that is multi-point as opposed to point-to-point, resulting in unpredictable performance and possibly damaged equipment.

Powered Device and Power Pourcing Equipment have not been added to the definitions. When other clauses use PD and PSE, a reader should be able to go to the definitions section for a breif definitions of the terms (after they have decoded then with the acronyms section)..

*SuggestedRemedy*

Add to definitions section 1.4:

1.4.x PSE: Power Sourcing Equipment

1.4.x PD: Powered Device

*Proposed Response* *Response Status* **C**

REJECT.

See section 1.5

I can find no place where there is a specification as to which side of the PSE is tied to ground (i.e. negative ground vs. the positive ground usually found in mid-fifties British sports cars with Lucas electrics.)

*SuggestedRemedy*

I request that a specification be added that dictates which side of the supply is common.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

An Environment A PSE shall switch the more negative conductor. It is allowable to switch both conductors.

Insert at the end of 33.4.1.1.1

setting mr_pse_enable to disable does not disable the PSE.

This is a late comment entered on behalf of the SM AdHoc to fix a deficiency discovered during rework of the SM.

*SuggestedRemedy*

create a new state called disable with the global entry of mr_pse_enable = disable.

*Proposed Response* *Response Status* **C**

ACCEPT IN PRINCIPLE.

This is resolved with details in document PSE_SM_4_01.PDF provided by Mike McCormack.
