# Analog Pre-Emphasis

## Agenda

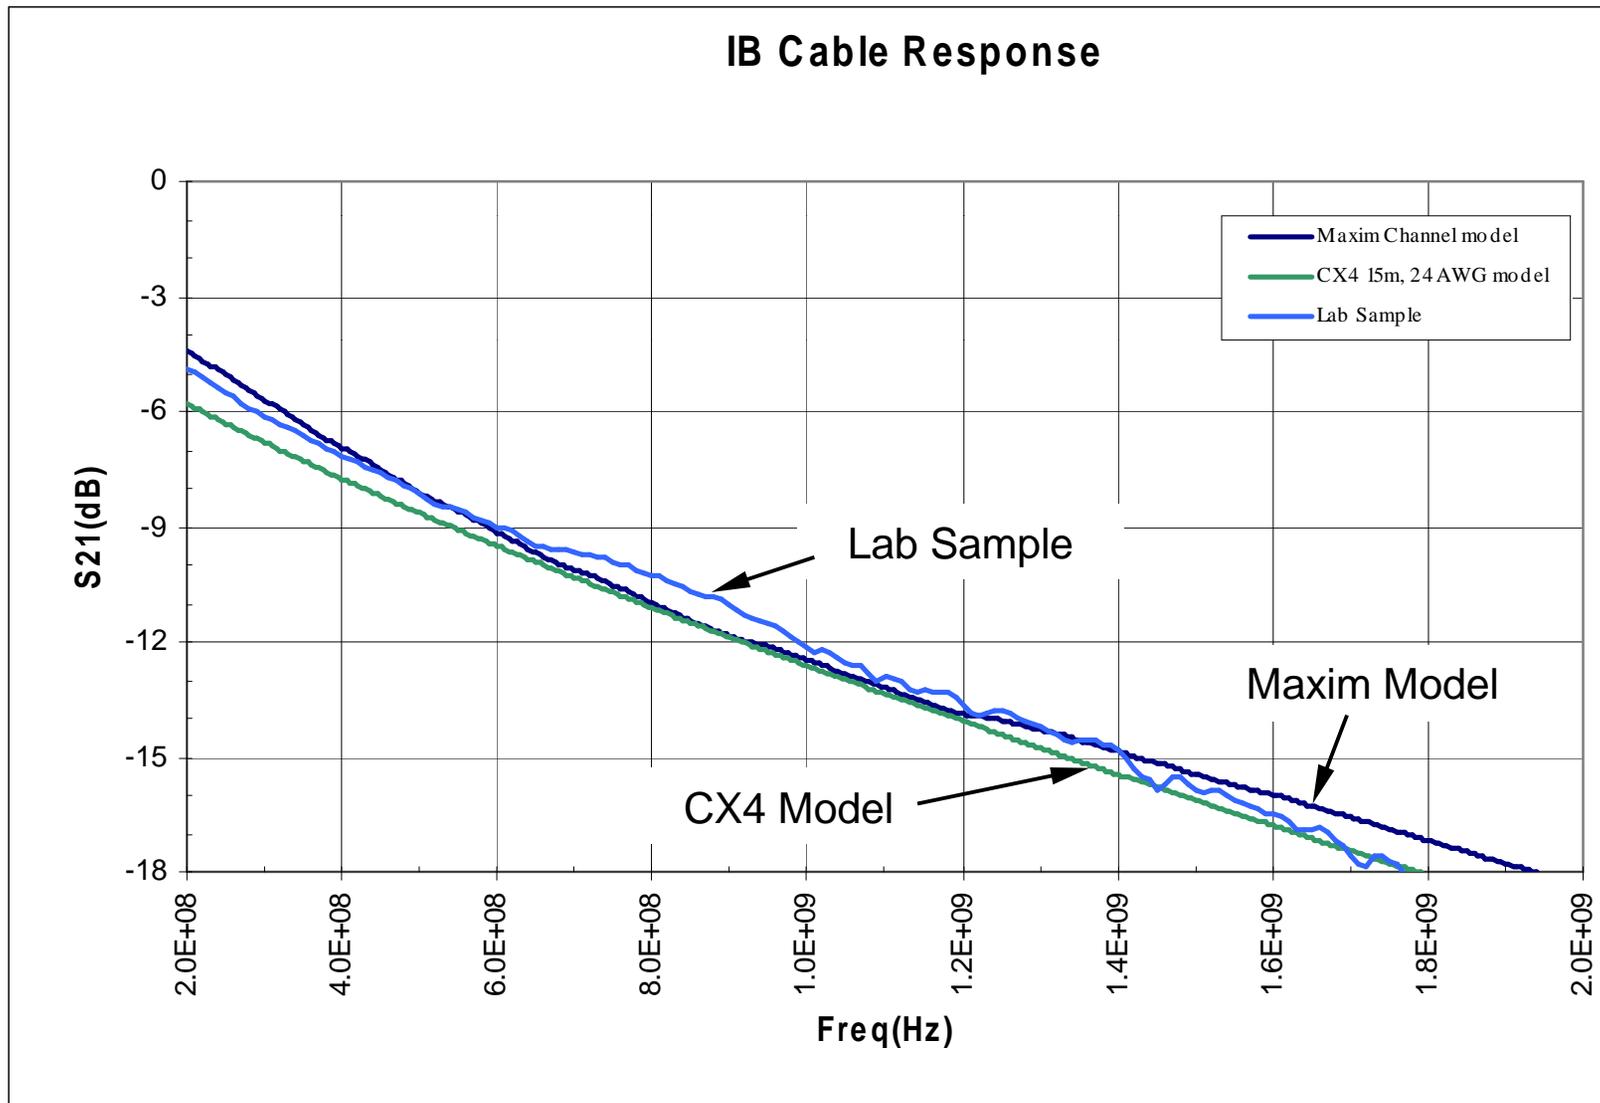

- Types of PE
- Demonstration of Analog filter for PE
- Comparison of Tx output to Tx template
- Recommendation

# Generating Pre-Emphasis

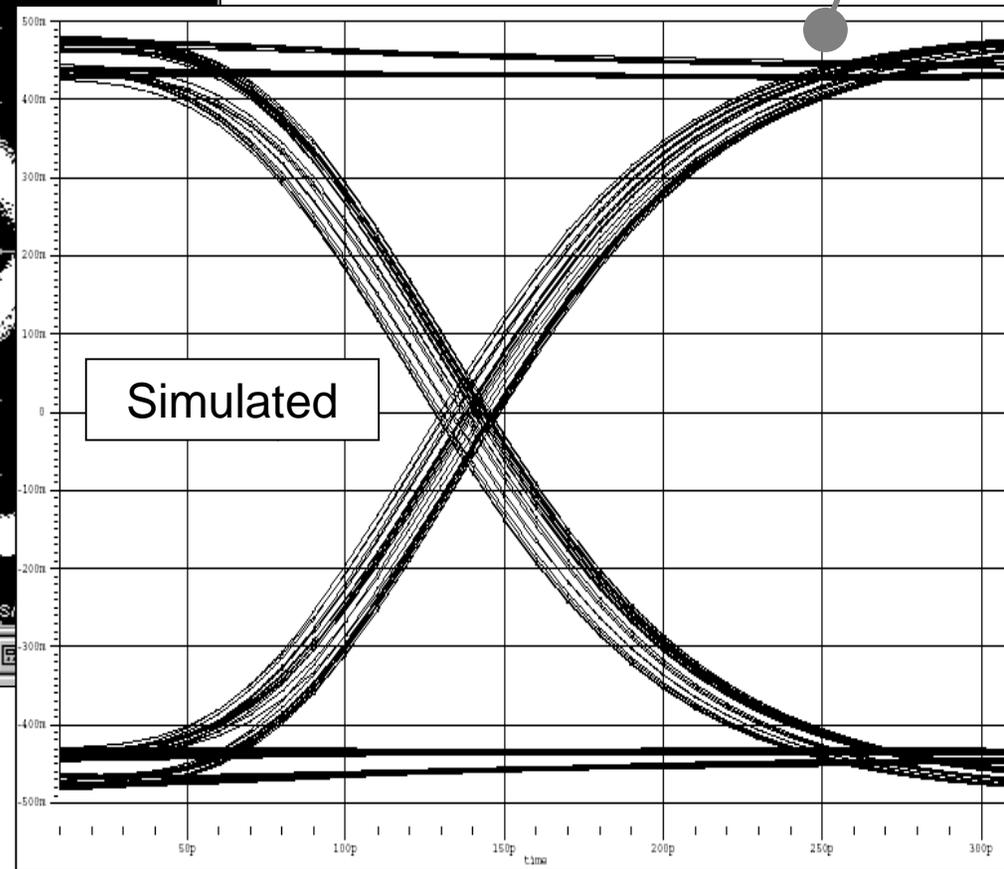

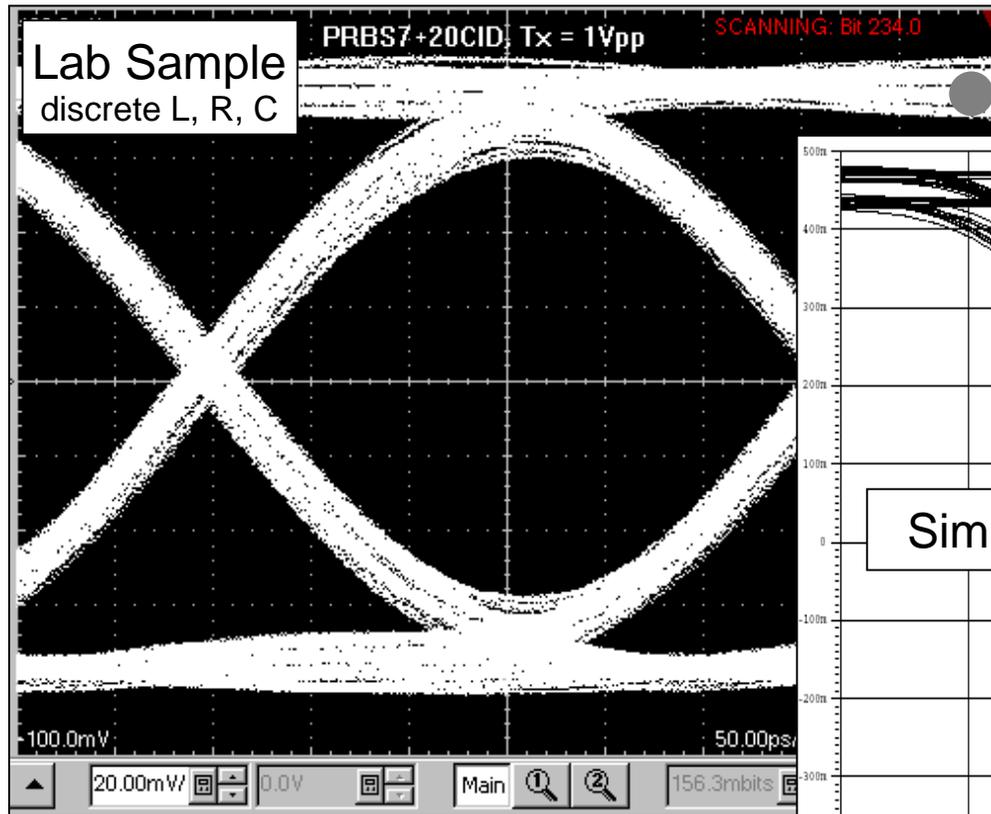

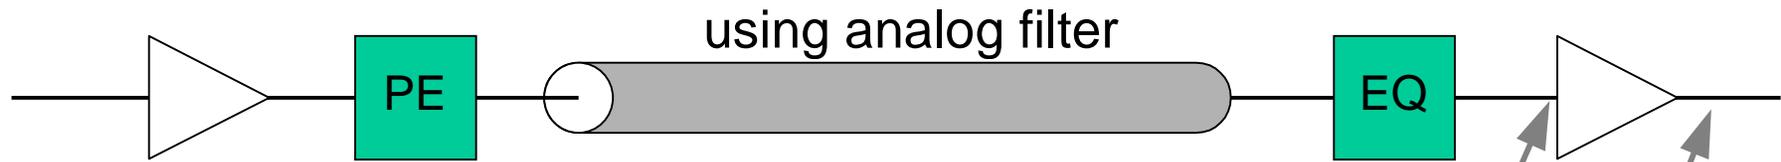

- **1-bit wide FIR**
  - easy to implement
  - crude approximation
- **Fractional or Sub-bit interval/multi-bit FIR**
  - better approximation
  - more complex
- **Analog Filter**
  - accurate transfer function
  - not an approximation
  - simple

# Modeling the Channel

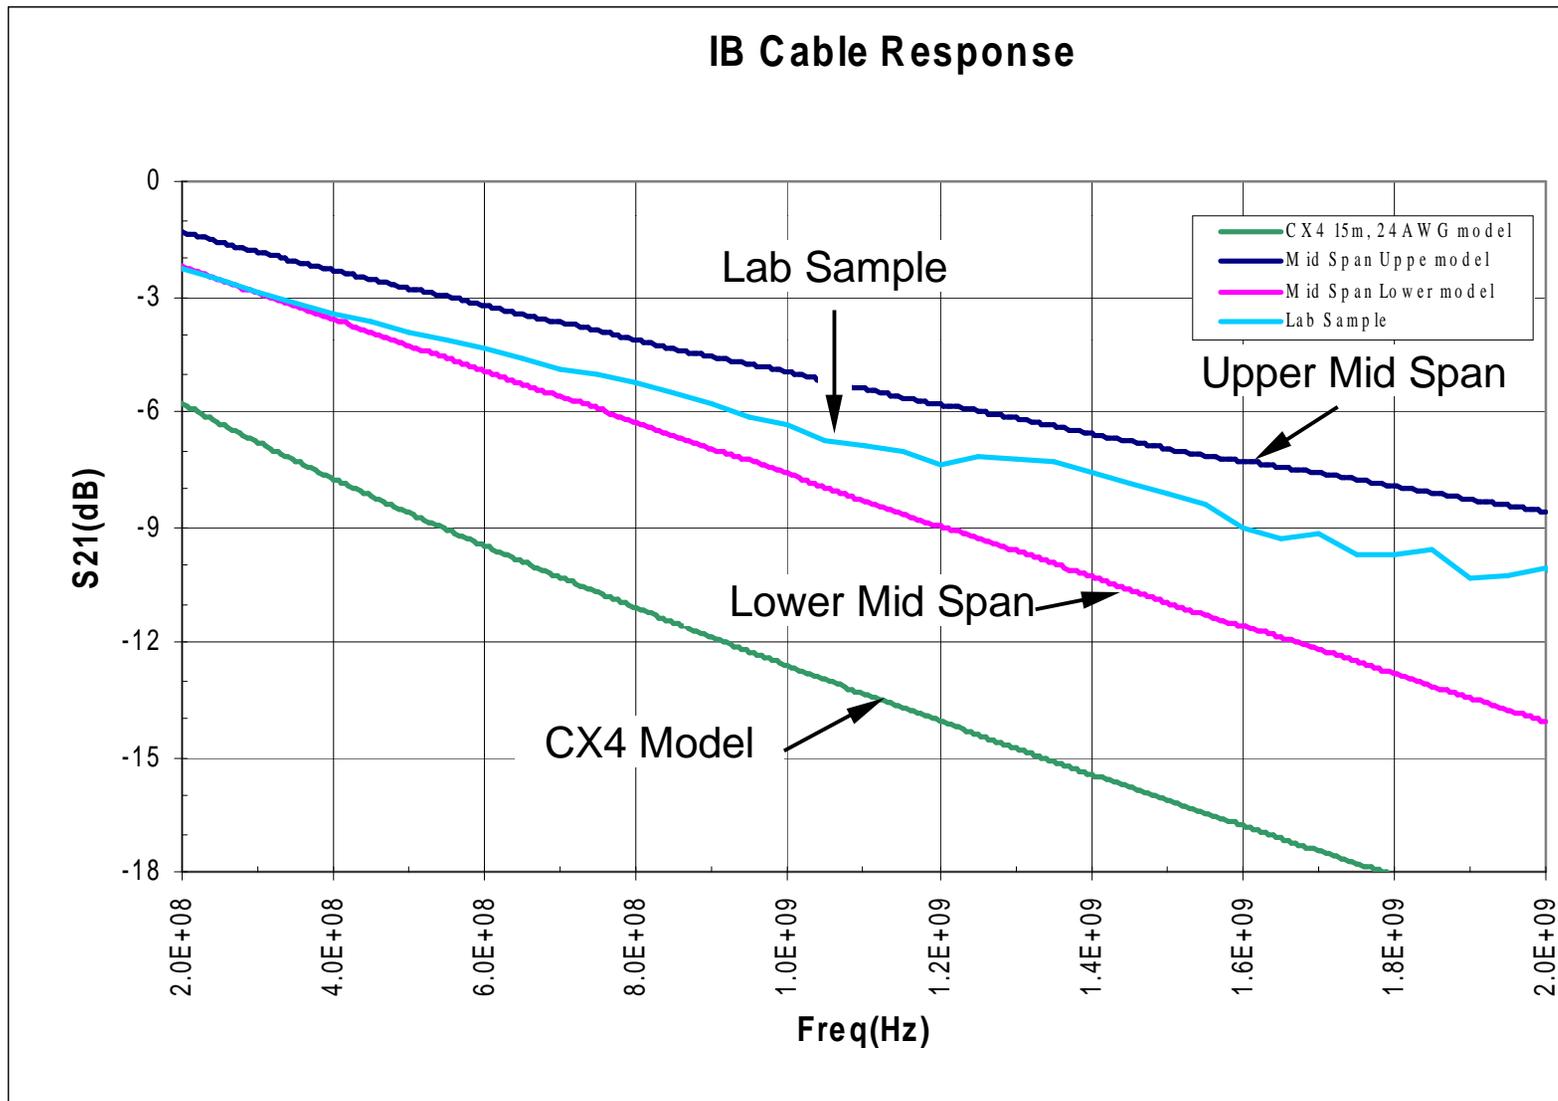

# End-to-End Compensation

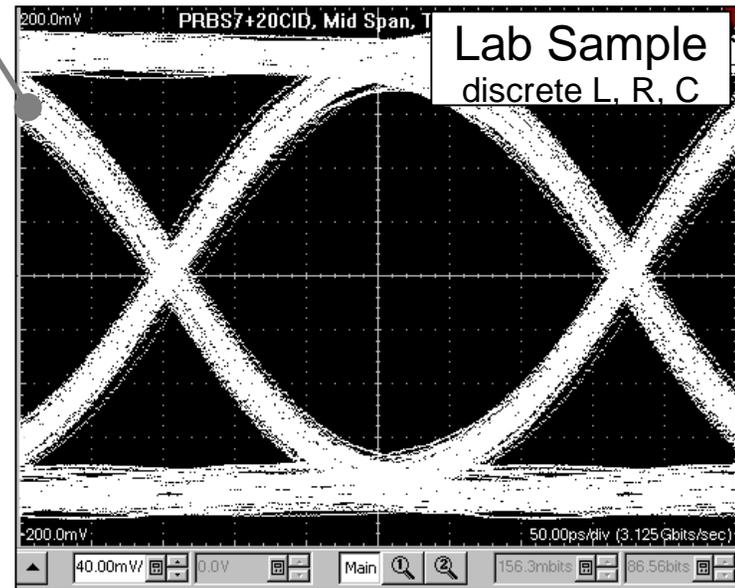

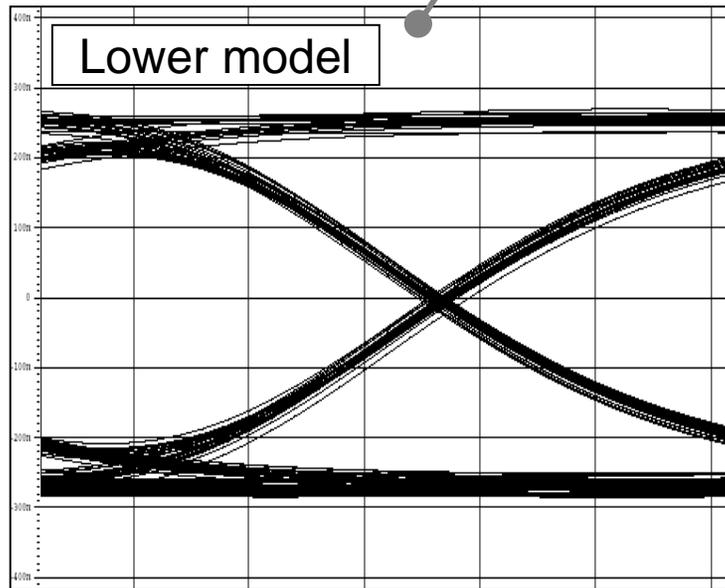

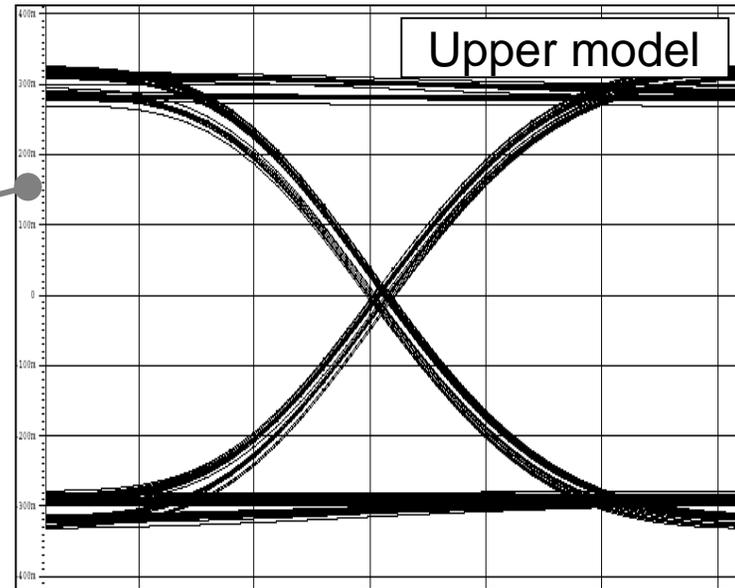

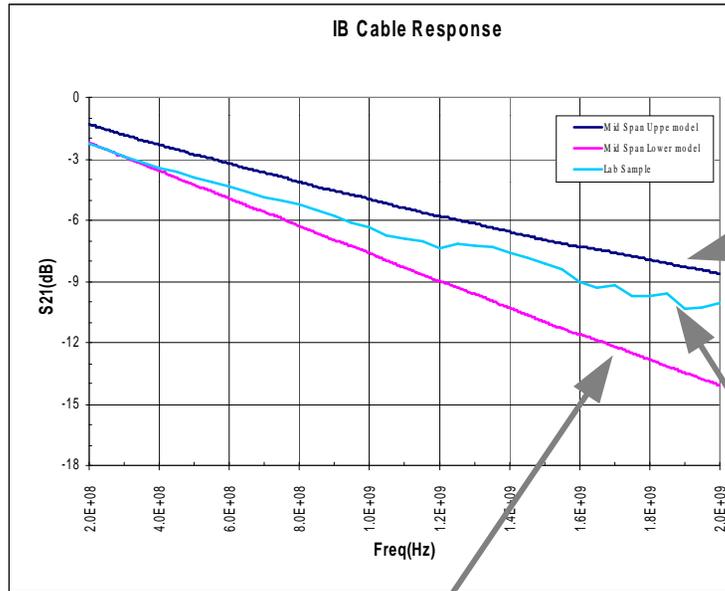

***Fully restored signal without retiming***

# Mid-Span Compensation

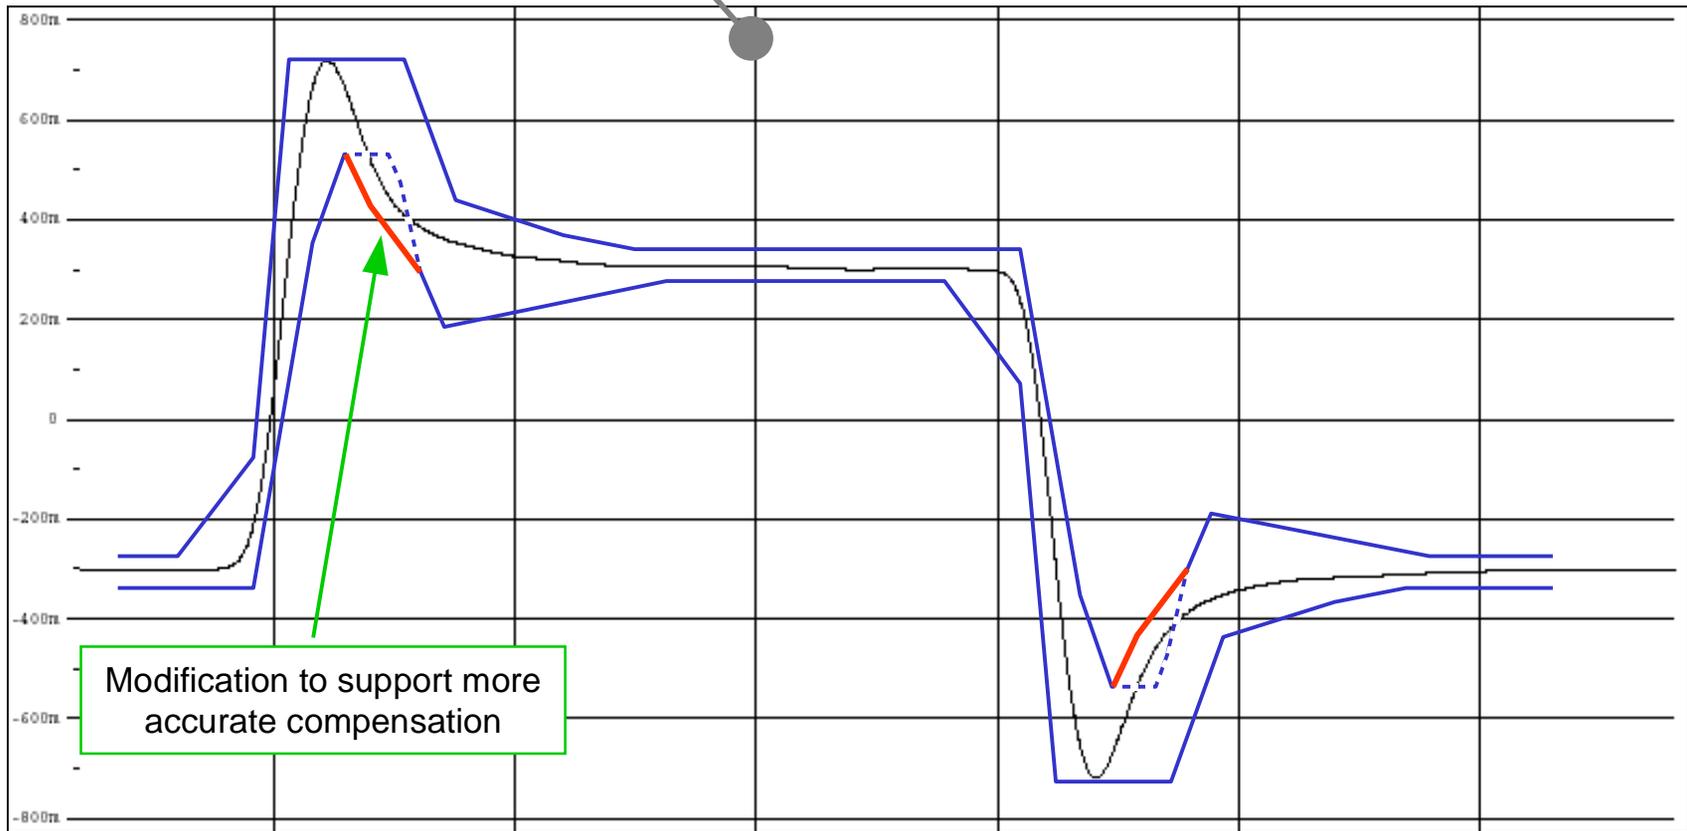

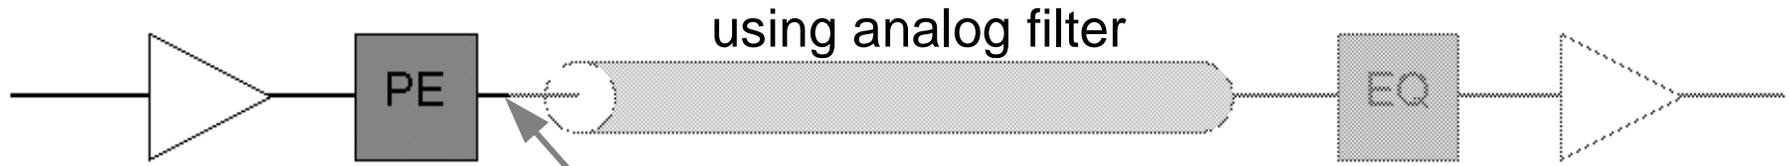

# Mid-Span Compensation

using analog filter

# Transmit Pre-Emphasis

# Tx Template Concerns

Existing Tx Template is crafted for 1-bit wide pre-emphasis and it is implementation specific.

This excludes more accurate solutions:

Fractional delay/sub-bit timing

Analog filter

# Tx Template Modification

## Existing CX4 Tx Template

3200	-0.4500	3200	-0.5500
3360	-0.4500	3360	-0.5500

## Conclusion:

An analog filter, or a good approximation, will deliver excellent compensation without retiming.

## Recommendation:

Modify the Tx Template to accommodate analog filters and sub-bit interval/multi-bit FIR.

- Use analog filter as the target transient response for sub-bit interval/multi-bit FIR
- 1-bit FIR will still fit the template
