

# Ripple Effects in S21

**Gopakumar Parameswaran**

**Jeff Cain**

# Contents

Cisco.com

- **Description of the problem**
- **Ripple effect examples in both frequency and time domain**
- **Ripple recommendations**

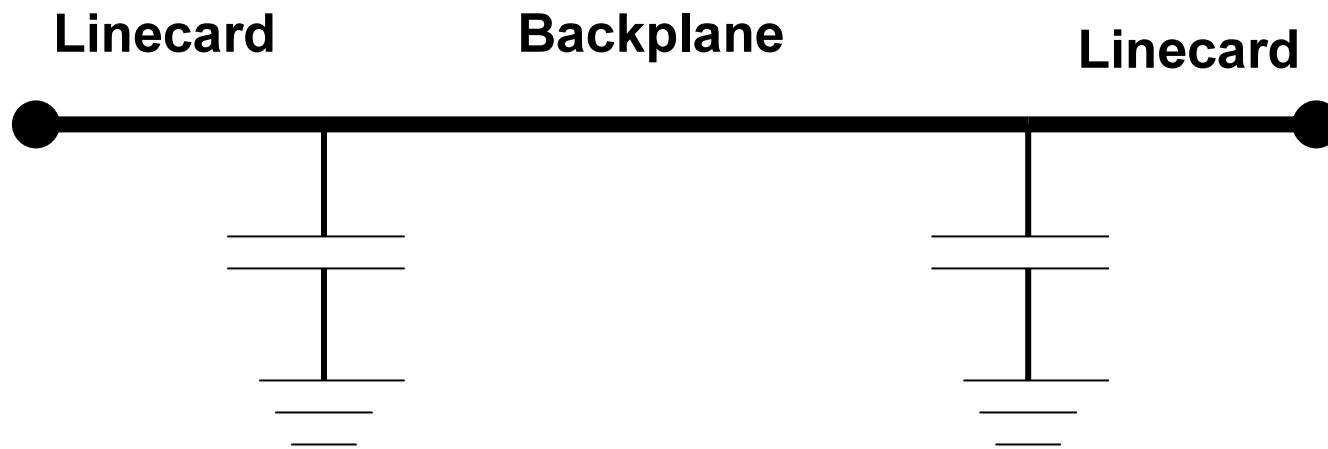

# Problem

Cisco.com

- The capacitive effects of the backplane connector vias set up reflected waves that cause ripple in the S21
- This ripple corresponds directly to time domain issues in the impulse response
- This study is a simulation using **ADS** software

# Simplified model

Cisco.com

**2 main methods for altering ripple:**  
**Change via/connector capacitance**  
**Change loss tangent for BP material**

# Quick sim results

Cisco.com

- By changing loss tangent

Loss tangent	Ripple Amplitude (dB)	Reflection ratio (%)
0	9	17.12
0.001	8.5	16.3
0.005	7	13.5
.01	5.6	10.9
.02	3.8	6.7
.05	2	3.3

Cap=2.7pF Length =???

# Quick sim results

- Changing capacitance:

Capacitance (pF)	Ripple Amplitude (dB)	Reflection ratio (%)
0	0	0
0.5	1.4	2.3
1.0	3.7	6.4
1.5	5.7	10.0
2.0	7.2	12.8
2.5	8	15.4

$\epsilon_r=0.001$  Length =???

# Conclusions

Cisco.com

- Ripple in S21 causes time domain effects that are outside the tap window for this solution
  - Where this noise occurs is related to the length of the backplane trace
  - This is true even if you are above the informative S21 limit
- Recommendation – consider this ripple as part of the total noise
  - Ripple + Cross Talk + Jitter
- First SWAG - ~5dB of ripple should be accounted
