#### IEEE P802.3ap/D3.0 Backplane Ethernet comments

This state diagram is too prescriptive. It forces all implementations to a second-best algorithr Can we do the job with words? I am aware of 1.2 and 21.5 saying how 802.3 does state diagrams but I don't believe this stops us doing the right thing; could have a flow diagram tha doesn't purport to be a state diagram (as we had a few drafts ago), or use words.

#### SuggestedRemedy

Try to define the lock requirements in words, based on the following. If we can't, give the committee's valid reason in the response, and change state machine so that: when in lock, rr consecutive correctable or uncorrectable blocks (any mix) cause FEC\_SIGNAL.indication to be false yet not necessarily cause a slip; m consecutive uncorrectable blocks cause loss of sync (as at present); recovery from either (sync'd but FEC\_SIGNAL.indication false) OR (out of sync) by n perfect blocks (as for initial block lock).

Comment Type E Comment Status X

In the line "parity\_invalid\_cnt = m +" the "+" falls partly under a line of the drawing (depending on screen magnification) and can be mistaken as a "\*"

#### SuggestedRemedy

When you fix or remove this state machine, check that any equations or similar don't lie unde lines. Thanks!

Comment Type TR Comment Status X

Submitted on behalf of Chris DiMinico.

To ensure interoperability channel parameters are typically normatively specified and include in the performance implementation conformance statement (PICS). The channel parameters are identified, in part, to enable appropriate tests against by which to assess the claim for conformance of the implementation. The PICS for Clauses 70, 71 and 72 (802.3ap-200x) do not include channel parameters and/or appropriate specifications/tests to ensure interoperability.

Annex 69B provides informative interconnect characteristics for differential, controlled impedance traces up to 1 m, including two connectors, on printed circuit boards residing in a backplane environment. Although Annex 69B states that the interconnect characteristics can be applied to a specific implementation of the full path (including transmitter and receiver packaging and supporting interaction of these components, the interconnect characteristics are not normatively specified and more importantly are not directly tied to appropriate tests (PICS) to ensure interoperability.

Recognizing that a backplane interconnect is highly dependent on implementation and the need to enable system trade-offs for the designer, a

subset of draft 2.4 channel parameters may be sufficient to ensure interoperability.

#### SuggestedRemedy

Clause: 69B

Page 188

Line: 3

Change informative to normative.

Add shall statements to the channel parameters necessary to enable appropriate tests by which to assess the claim for conformance of the implementation. Include those channel parameters in the Clauses 70, 71 and 72 (802.3ap-200x) PICS and/or appropriate specifications/tests to ensure interoperability.

Subclause: 69B.4.6.4

Page 195: Line 16.

Replace: It is recommended that ICRfit, offset by PILD and PSYS, be greater than or equal to ICRmin as defined in Equation (69B-26).

With: ICRfit, offset by PILD and PSYS, shall be greater than or equal to ICRmin as defined ir Equation (69B-26).

Subclause: 69B.4.5.

Page 192: Line 28:

Replace: It is recommended that the channel return loss, RL, measured in dB at TP1 and TP4, be greater than or equal to RLmin&.

With: The channel return loss, RL, measured in dB at TP1 and TP4, shall be greater than or equal to RLmin as defined in Equations (69B-12), (69B-13), and (69B-14).

Subclause: 69B.4.4.

Page 191: Line 34

Replace: It is recommended that ILD be within the high confidence region defined by Equatio (69B-10) and Equation (69B-11):

With: The ILD shall be within the high confidence region defined by Equation (69B-10) and Equation (69B-11):

Submitted on behalf of Chris DiMinico.

The range of frequencies over which the insertion loss parameters are specified (channel bandwidth) for each port type should be related to the port type signaling speed (signal bandwidth) or a rationale (technical justification) to characterize the channel bandwidth beyond the signal bandwidth should be provided. Why does fmax=15 GHz apply to all port types, e.g., KX,KX4 and KR. Why is the KR channel characterized to fmax=15 GHz? In addition, it would be helpful to have a single range of frequencies for the insertion loss parameter specifications for each port type or provide the rationale (technical basis) for the three different frequency ranges. Draft 2.4 includes channel parameters specified over three different frequency ranges (fmin to fmax), (f1 to f2), and (fa to fb).

Summary Draft 3.0

1. IL(f) and the A(f) ILD allowance are specified from fmin to fmax

2 Amax(f) frequency range is not explicitly specified.

3. ICR(f) - is specified from fa to fb

4. A(f) is specified from f1 to f2.

- 5. ILD(f) is specified from f1 to f2. For frequencies from f2 to fmax the ILD is bounded by ILmax(f).
- s bounded by ILmax(f).

#### SuggestedRemedy

- 1. Delete fmin parameter: Table 69B-1
- 2. Delete fmax parameter: Table 69B-1

3. Select either (f1 to f2) or (fa to fb) to reconcile ambiguity in frequency ranges for the insertion loss parameters (including Amax).

4. Limit the channel frequency specification range (f1 to f2 or fa to fb) to the required signal bandwidth for each port type.

The range of frequencies over which the insertion loss parameters are specified (channel bandwidth) for each port type should be related to the port type signaling speed (signal bandwidth) or the rationale (technical justification) to characterize the channel bandwidth beyond the signal bandwidth should be explicitly provided.         SuggestedRemedy       Limit the channel frequency specification (channel bandwidth) ranges plotted in Figure 69B-2 69B-3, and 69B-4 to the required signal bandwidth for each port type (f1 to f2 or fa to fb).         Proposed Response       Response Status       O | Comment Type         T         Comment Status         X           Submitted on behalf of Chris DiMinico.         1. In equation (69B-24) the PILD calculation results in a -0.8 penalty when ILD=0 and A(fb) Amax(fb)?           2. The IL deviations in 802.3ap is defined as the difference between the IL(f) and the least mean squares fit A(f). ILD(f) exhibits an oscillatory behavior over frequency. The PILD result in a level offset penalty and may not appropriately account for the oscillatory ILD channel set interference.           3. The source of the channel self-interference impairments generally associated with the oscillatory behavior is the re-reflected propagating waves (forward echo) often considered directly as a noise penalty.  |

## IEEE P802.3ap/D3.0 Backplane Ethernet comments

| HEALEY, ADAM B       Individual         Comment Type T       Comment Status X         The statement that the corresponding unit interval is nominally 96.96 ps is not precise or necessary       DUT reference clock). These two statements are at odds unless one assumes the offset covers all the cases of +/- 100 ppm. At best, the statement is redundant.         SuggestedRemedy       Strike the statement.         Proposed Response       Response Status O         CI 72       SC 72.7.1.4       P 108       L 52       # [61]         Comment Type T       Comment Status X       Comment Status X       Comment Type T       Comment Status X         30 mVp-p does not use the preferred subscript for "peak-to-peak". In addition, this text does not gapear in the corresponding subclauses for 1000BASE-KX and 10GBASE-KR and it is not clear that it needs to be here.       Status O   |  |   |   |   | . <u></u>  |   |   |                                      |  |
|---|--|---|---|---|--|---|---|--------------------------------------|--|
| The exit conditions from the NOT_UPDATED state can be simplified to add clarity. The function COEF_UPDATE yields a new coefficient output that is either within the valid range of the coefficient or output of the branches updates the coefficient and set the status code based value returned by COEF_UPDATE relative to valid range of the coefficient. Note of the branches updates the coefficient and set the status code based value returned by COEF_UPDATE relative to valid range of the coefficient. Note of the branches updates the coefficient value.       While "fise time" is a well understood term, this quantity is referred to as "transition time" to be consistent.         SuggestedRemedy       Update the state transition test conditions as follows: NOT_UPDATED to MAXIMUM is new_coef < MAX_LIMIT, NOT_UPDATED to UPDATED to MINIMUM is new_coef < MAX_LIMIT, "Tore_coef > MIN_LIMIT, NOT_UPDATED to MINIMUM is new_coef < MAX_LIMIT, "Tore_coef > MIN_LIMIT, NOT_UPDATED to MINIMUM is new_coef < MIN_LIMIT, "Tore_coef > MIN_LIMIT, NOT_UPDATED is (new_coef > # 60000000000000000000000000000000000  |  |   | L <b>2</b>  | # 59  |  |   |   | L 10                                 | # 62   |
| Update the state transition test conditions as follows: NOT_UPDATED to MAXIMUM is new_coef < MAX_LIMIT, NOT_UPDATED to UPDATED is (new_coef < MIN_LIMIT of the w_coef < MIN_LIMIT, NOT_UPDATED to MINIMUM is new_coef <= MIN_LIMIT, NOT_UPDATED to MINIMUM is new_coef <= MIN_LIMIT   | The exit conditions from<br>function COEF_UPDA<br>the coefficient or outsid<br>code based value return                     | m the NOT_UPDATED state c<br>TE yields a new coefficient ou<br>de of it. ### Comment Type TR Comment Status X

This is a comment against Annex 69B.

The purpose of a standard is to ensure a system will opperate when seperately manufactured compoments are combined to construct the system. This interopperability requirement for a standard can only be ensured if each of the system comonents are fully specified. Only when each piece is fully specified can someone assembling the system from seperately manufactured componets be assured the resultant system will work.

This draft has broken down the system into thre separate and distict components, each one which can come from a multitude of different vendors. These three components are: The transmitter, the backplane channel and the receiver. Each of these components has its limitations on how it can be tested and therefor on how it should be specified. In order to test component it has to be both able to be controlled and the affects of that controll have to be able to be observed.

The transmitter is very easily controlled and observed. The nature of the transmitter is to give it digital data of "1"s and "0"s and have it produce a waveform that can be applied to the channel. The transmitter by its mere nature is easily controlled and the results observed. A specification for the transmitter has already been drafted taking advantage of its nature. The channel is also a component that is easily controlled and the affects of that control observerd. Each end of the channel is exposed whereby test equiptment can be made to inject signals into it, control, and observe the signals at the output end, observed. The beginings of a specification for the channel have been started, however, the task force has ellected not to make it manditory that an 802.3ap system meet these, or any, channel specifications.

Although the reciever is very easily controlled, its inputs are redily available to stimulate with test signals, it is very dificult to observe. Even if the receiver specification is encumbered with internal nodes exposed for test purposes the fact is the function of the reciever is to take the incoming signals and turn them into digital "1"s and "0"s. This function alone means the only way to observe the final results of the reciever's function is to count how many times it functions properly. This is called Bit Error Ratio, BER.

The current specification for the reciever measures the receivers performance by measurein the BER it produces for a vastly reduced subset of channels as recommened by this Annex. The interference tollerance test only requires a lossy channel with near perfect return loss (no return loss) and lumps all external noise affects into one lump sum of AWGN. All this test does is show that a particular receiver will recover data and the expected BER for that one test channel in the presence of AWGN.

The only real way to guarantee a system will work is to require that the receiver recover data at the targeted BER when a compliant transmitter is transmitting a signal through a compliant channel. Since there is no compliant channel this cannot be done.

### SuggestedRemedy

Change Annex 69B from informative to normative. Change all recommended phrases to shal phrases and add appropriate pics section.

Proposed Response Response Status O

|---------|----------|------------|-----|-------|
| BAUMER, | HOWARD A | Individual |     |       |

Comment Type TR Comment Status X

This is a comment against Annex 69B.

When the informative channel models are taken as normative the link budget is not closed. That is there are a significant number of false positives. From the May 3, 2006 channel ad hc teleconference valliappan\_c2\_0506.pdf, column 7 shows peters\_B12,1,20,M1,20 & DAmbrosia\_6T channels as meeting BER targets. From the May06 interim mellitz\_01\_0506.pdf, slide #8 shows Peters\_B12,1,20,M1,20 & SAmbrosius\_1,2,3,4,5,7T channels passing the recommended channel limits. This takes into acount adjusting the maximum transmit aplitude and minimum transmit equalization per villiappan\_c2\_0506.pdf. The link budget needs to be closed, (i.e. no known false positives).

### SuggestedRemedy

Adjust the channel parameters such that ther are no known false positive channels. A presentation will be provided during the Sep06 interim with suggested changes.

Comment Type ER Comment Status X

This is a comment against Annex 69B.

Frequency limits for recommended Amax limit are missing causing confusion over which frequency range Amax should be compared against.

#### SuggestedRemedy

Add "for f1 <= f <= f2" as part of equation 69B-6 following the convention used for the other channel charateristics.

| Comment Type TR Comment Status X   | and aFECUncorrectableBlocks.  |
| The last sentence of the first paragraph states 'When Clause 73 Auto-Negotiation is enabled<br>a GET operation maps to the variable FEC enabled in Clause 45 register 7.48'.<br>[1] This statement appears to be in conflict with the next paragraph which describes the GET<br>operation without conditions and therefore would appear to apply globally. | Proposed Response Response Status O   |

operation without conditions and therefore would appear to apply globally. [2] I thought that the provision of Clause 45 MDIO interface was optional, hence the behaviou has to be described for the situation where the registers do not exist.

[3] The second paragraph states that a SET operation changes the current mode of operation. This would mean that after Auto-Negotiation is complete and FEC has been enabled as described in subclause 73.6.5 'FEC capability' a network manager can happily disable it - although this would not be reflected in a GET operation which since this is to use the result of the Auto-Negotiation. This would not seem the desired behaviour.

#### SuggestedRemedy

Merge this sentence with the existing second sentence and provide a descript of the behavio when Clause 45 MDIO is not present. The desired behaviour of the SET operation needs to be decided.

Comment Type **TR** 

SuggestedRemedy

Proposed Response

SC 69.3

v1 by -5, increase v2 by 20 and increase v3 by 5 so that the relative amplitudes of v2 and v3 change by 15 mV - the same relative change that would be legitimate for an update that increments c(-1).

For another example, an update to increment c(0) could increase v1 or v3 by 5 mV while increasing v2 by 20 mV. Again a 15 mV relative change with a similar effect on wave form to if c(1) or c(2) were incremented

### SuggestedRemedy

Require that the changes be the same for the two or three voltages that have the same direction of change in the table for a given update. I'm not sure how to word that clearly. For example for an increment to c(1), not only should v2 and v3 increase by 5 to 20 mV. It should also be required that the increases of the two voltages be the same to within 5 mV. Similarly when c(0) is incremented, the changes in all three voltages should be within 5 mV o each other.

| <ul> <li>10GBASE T is inserted after Rem Fault also, are these to go before 10GBASE-T? Insert order is quickly becoming a mystery to me, but there appears to be no reason for this order unless it is to be after 10GBASE-T and then it is appended to the sequence.</li> <li>SuggestedRemedy</li> <li>Change instruction to: Insert the following entries to "APPROPRIATE SYNTAX:" section, after 10GBASE-T (IEEE Std 802.3an-2006):</li> </ul>  | Comment Type       E       Comment Status       X         Unfortunately, this is the way 802.3aq should have been written, but it wasn't in D4.0.       Because 802.3an expanded the 11xx values, P802.3aq should be published with that expansion and the 1001 = 10GBASE-T declaration. Changes are properly marked against what published 802.3aq should be, but they aren't against P802.3aq.         SuggestedRemedy   |
| Proposed Response Response Status <b>O</b>   | Insert Editor's Note: P802.3aq/D4.0 did not include some 802.3an changes as its base text These base text updates are expected to be made in the IEEE Std 802.3aq-200x. Below  |
| GROW, ROBERT M Individual  | and P802.3aq/D4.0 assumes the published 802.3aq will include those IEEE Std 802.3an batext updates.<br>Change instruction to read: Change the reserved descriptions in Table 45-7 (including IEEE Std 802.3an-2006 and P802.3aq/D4.0 changes) as follows. If   |
