Cl **00** *SC* **0** *P* *L* # 243

Bennett, Michael LBNL

Comment Type **E** *Comment Status* **A**

at the risk of getting the 8-ball, I think we should be consistent about capitalization of Low Power Idle. For example:

page 30:
line 13 Low Power Idle
line 38 low power idle

page 36:
line 10 low power idle
line 33 Low Power Idle
line 53 Low power Idle

SuggestedRemedy

Use "Low Power Idle" in sentences. Use "low power idle" in labels in figures and tables.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Capitalize and use "Low Power Idle" when it is refers to a standard defined state or signal. Leave it in lower case when it is just normal English.

Also see response to comment #126 on the consensus on terminology in EEE

Cl **00** *SC* **0** *P* *L* # 270

Diab, Wael Broadcom

Comment Type **TR** *Comment Status* **A**

For management, we will also need to work on the contents of the C30 Annexes like 30A.

SuggestedRemedy

Please add the Annexes prior to WG ballot

Response *Response Status* **U**

ACCEPT IN PRINCIPLE.

If the 802.3.1 PAR is approved, they will take responsibility for these Annexes

Cl **00** *SC* **0** *P* *L* # 268

Diab, Wael Broadcom

Comment Type **TR** *Comment Status* **A**

Has the TF decided how to handle TPPMD? There seems to be several references in the editor's notes that there is a possibility to pull in TPPMD. There is significant technical content in editor's notes related to this.

SuggestedRemedy

Suggest that a a decision is made on this prior to WG preview so that document can be cleaned up one way or the other.

Response *Response Status* **U**

ACCEPT IN PRINCIPLE.

While we originally considered pulling TPPMD into 802.3, we were unable to find the resources to take on this task.

Editors notes indicating that we will pull in TPPMD will be removed.

Cl **00** *SC* **0** *P* *L* # 265

Diab, Wael Broadcom

Comment Type **TR** *Comment Status* **A**

There are several instances throughout the document where parameters are defined in multiple places, values are given in multiple places or different terminology is used for the same thing.

This can be more difficult to maintain and if there are subtle differences then it creates a potential conflict. Here are some examples:
- Table 78-2 summarizes key parameters and they are listed as TBD. However, a subset of these values are defined in the various PMD clauses that are being modified
- Section 78.1.3 overviews the LPI procedure. This text or portions of it are repeated in other places with inconsistent terminology. For instance, C78 used the terminology synchronous, while C55 uses the terminology symmteric.

SuggestedRemedy

Please consolidate to normative requirements in one place and consistant terminology. If readability is desired, a suggestion would be to make use of cross references.

Response *Response Status* **U**

ACCEPT IN PRINCIPLE.

Harmonization of terms will be carried out by the editorial team.

Clause 78 will contain a summary of key parameters for different PMDs but the normative text will be left to the specific PMDs

Hajduczenia, Marek ZTE Corporation

Comment Type **ER** *Comment Status* **R**

When refering to an Idle codeword, it should be named "Idle" and not "IDLE". "Idle" is what is used currently in 802.3

SuggestedRemedy

Global search & destroy: "IDLE" > "Idle" when referring to an idle character / symbol.

Response *Response Status* **U**

REJECT.

There is inconsistent capitalization in 802.3

See:
24.2.2.1.
IDLE
The IDLE code-group, as specified in 24.2.2.1.
IDLES
A code-group pair comprised of /I/I/; /I/ as specified in 24.2.2.1.

Plethora of unresolved references throughout the draft. Scrutinize the draft and update all references with xx characters in them.
Here is the list of missing references:
page 149, line 48, 53
page 150, line 1
page 154, line 48, 54
page 160, line 4, 5, 11, 14
page 163, line 7
page 165, line 20, 23
page 176, line 30
page 187, line 18, 20, 22, 24, 27

SuggestedRemedy

As per comment.

Response *Response Status* **U**

ACCEPT.

.x will be replace with actual references.

Cl **00** *SC* **0** *P* **00** *L* **0** # 126

Hajduczenia, Marek ZTE Corporation

Comment Type **ER** *Comment Status* **A** *lp terminology*

Consistency in definitions:
"low Power Mode"
"Low Power mode"
"Low Power Mode"
Pick one and stick to it consistently ...

SuggestedRemedy

IMHO pick "Low Power Mode", add it to list of abbreviations and use "LPM" consistently to avoid repeating this term everywhere (LPM is free in 1.5 in 802.3-2008)

Response *Response Status* **U**

ACCEPT IN PRINCIPLE.

Terminology will be rationalized as follows:
A) the term "state" will be used when referring to a defined state in the state diagram
B) The term "lower power mode" or "low power mode" can be used as a descriptive term to indicate that the transmitter or receiver is conserving power relative to normal operation. Normal rules of capitalization and grammar shall be followed. Don't use "Low Power Idle mode" for this purpose.
C) "Low Power Idle" will be used to refer to the signal used.

Attempting to harmonize terminology on state names, variables etc across PHY clauses is putting us in conflict with the attempt to harmonize terminology within a clause and we will emphasise consistency in naming within the clause.

Dawe, Piers Avago Technologies

Comment Type **T** *Comment Status* **R**

Containing the growing clause title length, and as the medium isn't baseband (it's just a wire, it doesn't know; it's the modulation scheme that's baseband)

SuggestedRemedy

Delete 'baseband' before medium.

Response *Response Status* **C**

REJECT.
Comment actually refers to Clause 14, Page 20, line 6

This usage is not unique to clause 14 and should be handled in maintenance.

Cl **14** *SC* **14** *P* **20** *L* **6** # 279

Booth, Brad AMCC

Comment Type **TR** *Comment Status* **R** *LATE*

I have some concern about using a lower case letter with a port type. Does the port type naming convention require upper case?

SuggestedRemedy

Change the port type from 10BASE-Te to 10BASE-TE.

Response *Response Status* **U**

REJECT.

There is not a port type naming convention defined. During an earlier meeting, this issue was discussed and the preference at that time was for using a lower case for 10BASE-Te.

Cl **14** *SC* **14.1** *P* **20** *L* **17** # 284

Booth, Brad AMCC

Comment Type **ER** *Comment Status* **R** *LATE*

It is misleading to refer to the 10BASE-Te as being the Energy-Efficient PHY type as this does not use the protocol described in Clause 78.

SuggestedRemedy

Remove reference to Energy-Efficient relative to 10BASE-Te and stipulate that this port type has reduced voltage range requirements.

Response *Response Status* **U**

REJECT.

10BASE-T, by its original definition, implements the low power idle concept being proposed in Clause 78.

When there is no data to send, there is no signal being transmitted.

10BASE-Te uses the same signaling method as 10BASE-T and makes it energy efficient by lowering transmit voltage range.

Cl **14** *SC* **14.1.1** *P* **20** *L* **16** # 21

Dawe, Piers Avago Technologies

Comment Type **E** *Comment Status* **R**

The layer diagram could be improved. If you change it...

SuggestedRemedy

Change the 7-point material to 8 point.
Change the ALL CAPS to normal upper and lower case.
Move 'Higher layers' down so that it doesn't make 'LAN CSMA/CD layers' look like more layers in the stack. Suggest putting 'OSI reference model layers' and 'LAN CSMA/CD layers' at the same level, underlined, to show they are headings for the stacks not layers in the stacks.

Response *Response Status* **C**

REJECT.

Out of scope for this project. Editor suggests commenter recommend this to the next maintenance project.

Cl **14** *SC* **14.1.1** *P* **20** *L* **19** # 20

Dawe, Piers Avago Technologies

Comment Type **E** *Comment Status* **A**

I thought it had been decided not to maintain 'ISO/IEC 8802-3 LAN International Standard'. Anyway, a document referring to itself as 'International Standard' is posturing.

SuggestedRemedy

Change
'The relationship of this clause to the entire ISO/IEC 8802-3 LAN International Standard is shown in Figure 14-1.'
to
'Figure 14-1 shows the relationship of the 10BASE-T or 10BASE-Te PMA, MDI and medium (shown shaded) with other sublayers, to the ISO/IEC Open System Interconnection (OSI) reference model.'

Response *Response Status* **C**

ACCEPT.

Editor will follow suggested remedy.

The commenter has a valid point point - we should self-reference to 802.3. Based on the PSDO agreement we have with ISO we would still consider ourselves a international standard - so the sentence in question could now read:

'The relationship of this clause to the entire IEEE Std 802.3 LAN International Standard is shown in Figure 14-1.'

The challenge is that we wont have the chance to do this throughout the standard to all layer diagrams until the next revision so we are going with the change recommended by the commenter.

Barrass, Hugh Cisco

Comment Type **T** *Comment Status* **A**

There doesn't seem to be any point in negotiating the value of the lpi_rx_tw_timer. The transmitter must wait for at least 30us before it can send data, so there's no benefit to negotiating a smaller value (and it's very small anyway). Negotiating a longer wakeup time would not allow any extra power savings as the transmitter has already started sending IDLE or /P/P/.

SuggestedRemedy

Change

This timer is set to a default value 30us and can be negotiated during Auto-negotiation or with LLDP.

to

The value of this timer is fixed to 24us.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Would like to keep the timer vaue to 30us since it is used to determine if the link fails.

Cl **25** *SC* **25.4.11.5** *P* **60** *L* **19** # 47

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

The wake time for the 100BASE-TX receiver is dependent on the time required to activate the far-end transmitter. Furthermore, the receiver should have some assurance of a compliant input signal upon which to base timing recovery and adaptive equalization. Neither of these aspects of transmitter behavior are currently defined in the draft.

SuggestedRemedy

Specify that the transmitter:
1. Shall deliver a signal that will assert signal detect within TBD1 us following transmitter activation
2. Shall deliver a fully compliant 100BASE-TX signal within within TBD2 (> TBD1) us following transmitter activation

Response *Response Status* **C**

ACCEPT.

25.4.11.8 Changes to 10.1.2 "Transmitter"

During the Low Power Idle mode, when tx_quiet is deasserted, the transmitter output shall deliver a signal that exceeds Signal_Detect assertion threshold within 2 us, and deliver a fully compliant 100BASE-TX signal within 5 us.

Cl **25** *SC* **25.4.11.5** *P* **60** *L* **19** # 335

Dove, Daniel ProCurve Networking

Comment Type **TR** *Comment Status* **A** *LATE*

Table values for Assert Time and Deassert Time are set to 5uS. These periods of time are inconsistent with the Assert Threshold of 1000mV pk/pk and the Deassert Threshold of 200mV.

Those thresholds apply for 350uS because the 100BASE-T encoding of IDLE guarantees a "fat pulse" (pulse duration of 10 bits) will arrive at the receiver in this timeframe.

If we are to reduce the Assert/Deassert times, we cannot guantee the "fat pulse" arrival any more, and need to change the thresholds.

SuggestedRemedy

Since we want to keep the 5uS timers, my recommendation is to analyze the amplitude requirements and change the Assert/Deassert thresholds

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Note: Will add the following statements and modify Table 25-3.

25.4.11.6 Changes to 10.1.1.1 "Signal_Detect assertion threshold"

The TP-PMD subclause 10.1.1.1 is applicable during the normal operation. During the Low Power Idle mode, when rx_lpi is asserted, Signal_Detect shall be asserted per 25.4.11.3 for any valid peak to peak signal, VSDA, of >400 mV.

25.4.11.7 Changes to 10.1.1.2 "Signal_Detect deassertion threshold"

The TP-PMD subclause 10.1.1.2 is applicable during the normal operation. During the Low Power Idle mode, when rx_lpi is deasserted, Signal_Detect shall be deasserted per 25.4.11.4 for any valid peak to peak signal, VSDA, of <200 mV.

Add editors note saying: Further analysis of hysteresis is required to make sure that transients of signal turning off do not trigger the thresholds.

Cl **25** *SC* **3** *P* **54** *L* **16** # 245

Bennett, Michael LBNL

Comment Type **ER** *Comment Status* **A**

The cable plant specifications for untwisted shielded pair (UTP) of TP-PMD 11.1 are actually in 25.4.6.

Cl **28C** *SC* **28C.12** *P* **196** *L* **41** # 48

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

I'm not sure where to anchor this comment, but Annex 28D should also be amended to outline extensions of Clause 28 for Energy Efficient Ethernet and I propose that Clause 28 extensions for EEE include:

1. Auto-Negotiation is mandatory for a EEE PHY (this is currently not the case for 100BASE-TX)
2. The exchange of additional next pages for EEE capability and mode negotiation extends the time required to complete Auto-Negotiation. To reduce this time, a EEE PHY may use the extended next page mechanism introduced by IEEE 802.3an-2006 (it is not currently an option for 100BASE-TX).

SuggestedRemedy

Add amendment to Annex 28D per comment.

In clause 35, there are again references to subclauses using "a" and "b" in the number. Avoid it. Insert a new subclause if needed and call for renumbering of the remaining subclauses.

SuggestedRemedy

As per comment.

Response *Response Status* **C**

REJECT.

IEEE Standards Association staff editors have instructed the editors of 802.3 amendments to use this approach when added clauses between existing clauses of the base document. To renumber all the clauses of the base document would open too much of the base to changes and would cause confusion about what was being changed.

The clauses will all be renumbered during the next revision, when all amendments are gathered together and brought into the main document (along with maintenance changes).

In the PHY Control state diagram, as proposed for Energy Efficient 1000BASE-T, it is possible that loc_rcvr_status = OK while SEND_Z is asserted. Unless the definition of Sdn[2] is modified, channel C may not send zero as desired.

SuggestedRemedy

Modify defintion of Sdn[2] to read:

Sdn[2] = Scn[2]^TXDn[2] if (tx_enablen-2=1)
Scn[1]^1 else if (loc_rcvr_status=OK) * (tx_mode!=SEND_Z)
Scn[2] else

Response *Response Status* **C**

ACCEPT.

Note the typo in the suggested remedy, "Scn[1]^1" should be "Scn[2]^1."

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A** *40_PHY_Control*

The abbreviated state names may bias the perception of the function of each state in a manner that was not intended. Additional text may be provided to 40.4.2.4 to guide a user of the standard and reduce the possibility of misunderstanding that could lead to interoperability issues.

A key issue in question is whether the adaptive filter coefficients should be updated during the WAKE_TRAINING state. The intended behavior was to have the filter coefficients adapted during the UPDATE state per the current text in Draft 1.0.

"If both PHYs continue to request low power operation, then both PHYs remain in the UPDATE state and continue to transmit for time defined by lpi_update_timer. This time is intended to allow the remote PHY to refresh its receiver state (e.g. timing recovery, adaptive filter coefficients) and thereby track long term variation in the timing of the link or the underlying channel characteristics."

It was not intended that adaptive filter coefficient would be updated during WAKE_TRAINING, and attempting to do so could makes the implementation subject to undesirable corner cases. However, this is not clearly stated.

It is proposed that the current text be updated to make the intention clear.

SuggestedRemedy

Clearly state that adaptive filter coefficients should be updated in the UPDATE and SEND IDLE OR DATA states and not in the WAKE_TRAINING or WAKE_SLAVE states.

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

There may be ambiguity regarding the definition of scr_status with the addition of the signal_detect function for Energy Efficient Ethernet. To ensure correct interpretation of the operation of the state diagram, such ambiguity should be removed.

Per the current definition of scr_status, it may assume one of the following two values:
OK: The descrambler has achieved synchronization.
NOT_OK: The descrambler is not synchronized.

It seems to follow that once you have determined there is no input signal (e.g. signal_detect = FALSE), the scrambler cannot be synchronized.

SuggestedRemedy

Specify that, for Energy Efficient Ethernet, when signal_detect = FALSE, scr_status must be set to NOT_OK.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

when zero_detect = FALSE, scr_status must be set to NOT_OK.

Cl **40** *SC* **40.4.5.1** *P* **86** *L* **44** # 79

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A** *40_mr_enable*

It should be stated that when the optional Energy Efficient Ethernet feature is not implemented, loc_lpi_req and rem_lpi_req are FALSE and, as a consequence, lpi_mode is OFF. This will prohibit transition into the optional LP_IDLE state in the PCS Receive state diagram, part a (Figure 40-10a), into the optional PHY Control state diagram, part b (Figure 40-15b), and obviate the need for the optional PCS Local LPI Request state diagram (Figure 40-9).

Similar conditions should be applied when the Energy Efficient Ethernet feature is disabled by management.

SuggestedRemedy

Per comment.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
When optional Energy Efficient features are not implemented, the default values for the cited variables should be defined per the comment. This has the effect of restoring "baseline" 1000BASE-T operation.

As pointed out by comment #208, there is no means to enable or disable Energy Efficient Ethernet via management.

The programmable wake timer seems to be too complex for a very small benefit.

The timer should be fixed to the smallest value that is generally acceptable.

SuggestedRemedy

Change

Duration: This timer is a negotiated parameter [add reference] not to exceed 16 us.

to

Duration: This timer shall have a period of 16 us.

Response *Response Status* **C**

ACCEPT.

See also #62.

Cl **40** *SC* **40.4.5.2** *P* **87** *L* **51** # 192

Grimwood, Michael Broadcom Corporation

Comment Type **TR** *Comment Status* **A** *40_tw_negotiation*

lpi_wake_time is specified to be less than or equal to 16 µs. However, under best-case implementation assumptions and propagation delays, it is still possible that wake can take up to 3.8 µs since this is the sum of the minimum lpi_wakemz_timer and lpi_waitwt_timer values. Therefore, the parameter range and associated allowable autonegotiation values should be constrained such that wake time is greater than or equal to 3.8 µs and less than or equal to 16 µs. Because the wake time is negotiated in 1 µs increments, the allowable range for lpi_wake_time should be 4 µs to 16 µs.

SuggestedRemedy

Change:

Duration: This timer is a negotiated parameter [add reference] not to exceed 16 µs.

To:

Duration: This timer is a negotiated parameter [add reference] with a value greater than or equal to 4 µs and less than or equal to 16 µs.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Cl **40** *SC* **40.4.5.2** *P* **88** *L* **31** # 81

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

Per the current Energy Efficient Ethernet PHY Control state diagram, it is possible that the MASTER will be required to decode rem_lpi_req from the SLAVE while the SLAVE is receiving zeros from the MASTER (e.g. the timing loop is broken).

This scenario would occur when the MASTER's lpi_update_timer expires and the MASTER transitions to WAIT_QUIET, transmitting zeros to the SLAVE while the SLAVE is still in the UPDATE state. Prior to the SLAVE detecting zeros from the MASTER, it chooses to exit low power idle. The MASTER will need to detect the SLAVE's rem_lpi_req = FALSE with the timing loop open.

Since the timing loop will be open for a very short period of time, this is likely not an issue. However a very simple change to lpi_update_timer can eliminate this corner case.

The change would make the duration of MASTER lpi_update_timer longer than the SLAVE lpi_update_timer. This ensures that the SLAVE always enters WAIT_QUIET before the MASTER, and hence maintains timing. In addition, it has negligible impact on the total refresh time since the SLAVE transition to WAIT_QUIET will force the MASTER to transition to WAIT_QUIET.

SuggestedRemedy

Define that the duration of lpi_update_timer for the SLAVE is 0.18 to 0.2 ms and duration of lpi_update_timer for the MASTER is 0.23 to 0.25 ms.

Response *Response Status* **C**

ACCEPT.

Cl **40** *SC* **40.4.5.2** *P* **88** *L* **6** # 190

Grimwood, Michael Broadcom Corporation

Comment Type **TR** *Comment Status* **A** *40_signal_detect*

In order to accommodate the new requirement for signal_detect_deassertion_time (comment submitted separately), the lpi_waketx_timer value needs to be modified such that (lpi_wakemz_timer - lpi_waketx_timer) >= signal_detect deassertion time. So for the minimum value of lpi_wakemz_timer (2 µs), the signal detect deassertion time must be <= 1.0 µs.

SuggestedRemedy

Change:

This timer shall have a period between 1.2 µs and 1.4 µs.

To:

This timer shall have a period between 0.8 µs and 1.0 µs.

Grimwood, Michael Broadcom Corporation

Comment Type **TR** *Comment Status* **A** *40_PHY_Control*

The state diagram in figure 40-15b has an exit condition from the wake_silent state that depends on scr_status. scr_status is ambiguous and therefore this condition can lead to interoperability issues. Also, allowing the wake_silent state in LPI mode to be executed under some conditions and bypassed under others unnecessarily introduces additional combinations of state transition sequences that also can contribute to interoperability issues.

SuggestedRemedy

A presentation will be submitted proposing a remedy.

A bit is required for "clock stoppable" as used in Clause 22 etc.

SuggestedRemedy

Add the following:

Change Table 45-83 to add "clock stoppable" bit

(change 3.0.10:7 Reserved to 3.0.9:7 Reserved)

Add subclause 45.2.3.1.3a

45.2.3.1.3a Clock Stoppable (3.0.10)

A PHY that supports low power idle signaling may stop the derived xMII receive clock while it is signaling low power idle in the receive direction. If bit 3.0.10 is set to 1 then the PHY may stop the receive MII clock while it is signaling low power idle otherwise it shall keep the clock active. If the PHY does not support low power idle signaing or is not able to stop the receive clock then this bit has no effect (see 22.2.2.9a, 35.2.2.9a, 46.3.2.4a).

Comment Type **T** *Comment Status* **R**

Regarding the 1000BASE-T wakeup time advertisement...

Based on the premise that longer wake time corresponds to additional power savings (e.g. PHY layer circuitry may be put into a deeper sleep state) and there will exist applications that do not require a wake time as fast as 16 us, there is an advantage to increasing the upper bound on the advertised wake time.

Also, based on the premise that management may manipulate the advertised wake time to be larger than the minimum value supported by the PHY, this mechanism does not allow the local device to indicate that it supports a faster wake time than advertised. Consider a local device that has prioritized power savings and therefore advertises a slower wake time than the PHY can support but would be able to support the faster wake time if necessary. A link partner with an application that requires lower latency, and requests a faster wake time, may not be able to arbitrate a suitable wake time with the local device despite the fact the local device actually supports the desired wake time.

SuggestedRemedy

Proposal for modified 1000BASE-T wake time negotiation to be presented to the Task Force (tentative name healey_01_1108.pdf).

I believe there is a small bug in one of these tables. It may be this: the PLS_DATA.indication parameter for Start is shown as 'No applicable parameter, first eight ZERO, ONE of a frame (a preamble octet). But we know what a preamble octet is.

SuggestedRemedy

Should the PLS_DATA.indication parameter for Start be 10101010 (binary)? Similarly in Table 46-4.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The preamble octet is replaced by the start character, that is why there is no applicable parameter.

However, the word "replaces" has mysteriously disappeared from this location. Therefore that cell must be changed back to its original form:

'No applicable parameter, replaces first eight ZERO, ONE of a frame (a preamble octet). "

McClellan, Brett Solarflare

Comment Type **T** *Comment Status* **A**

I'm concerned about the choice to break up XAUI coded idle columns with the /D20.5/ character to indicate LPI. From my limited knowledge of the XGXS PCS receiver it appears to me that breaking the ||A|| columns will prevent the PCS from finding or maintaining column alignment and breaking the ||R|| column may prevent the PCS from performing clock rate compensation, thus causing fault conditions which would be indicated by local fault at the XGMII and requiring additional recovery time.

SuggestedRemedy

I would like to hear comment from vendors of the XGXS PCS on whether this change is of any concern. Or, if this has already been reviewed within the task force perhaps the editor can direct me to a presentation justifying the change.

Response *Response Status* **C**

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

How does a user of the standard know if the implementation meets the requirement of randomness?

SuggestedRemedy

Rigorously define the desired progression of /D20.5/ code-group insertion for each successive column.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The user of the standard has already overcome his fear of "randomness" when he implemented bullet item "e) When not sending an ||A||, either ||K|| or ||R|| is sent with a random uniform distribution between the two."

However, the term "random" needs a little more clarity.

Replace "inserting /D20.5/ randomly in one column"

with "inserting /D20.5/ with a random uniform distribution in one of the columns"

Cl **48** *SC* **48.2.4.2** *P* **110** *L* **18** # 63

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

"Low Power Idle is indicated by inserting /D20.5/ randomly in one column of each row during ||I||."

A /D20.5/ code-group is randomly inserted into one LANE of each ||K|| or ||R|| COLUMN. ||I|| also includes the align column ||A||, and inserting /D20.5/ into an ||A|| will result in repeated deskew_error indications and eventually loss of alignment indication (align_status = FAIL).

SuggestedRemedy

Correct definition per comment.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Add after 'during ||I||'

'to replace ||K|| or ||R|| (not ||A||)'

Page and line numbers in P802.3ayD2.3.
Need to make clear that the new codings in Table 49-1 are optional.

SuggestedRemedy

Add sentences after 'The control characters and their mappings to 10GBASE-R control codes and XGMII control codes are specified in Table 49-1. All XGMII and 10GBASE-R control code values that do not appear in the table shall not
be transmitted and shall be treated as an error if received.':
The ability to transmit or receive Low Power Idle is an option, to support an option of 10GBASE-KR only.' If this option is not supported or not enabled, Low Power Idle shall not be transmitted and shall be treated as an error if received.' Add PICS to support the shalls.

Response *Response Status* **U**

ACCEPT IN PRINCIPLE.

Change 49.2.4.4

After "shall not be transmitted and shall be treated as an error if received."

Add

'The ability to transmit or receive Low Power Idle is an option for certain PHYs to support Energy Efficient Ethernet (see Clause 78). If this option is not supported Low Power Idle shall not be transmitted and shall be treated as an error if received.'

Cl **55** *SC* **55.1.3** *P* **114** *L* **43** # 174

Taich, Dimitry Teranetics

Comment Type **ER** *Comment Status* **A**

1The text reads:
"10GBASE-T PHYs optionally provide support for Low Power Idle (LPI) as part of Energy Efficient Ethernet (see Clause 72). This extension allows PHYs to enter a low-power idle state of operation when the MAC requests low power operation."

Since 10GBASE-T supports assymetrical LPI operational mode PHY can enter LPI state also when Link Partner has entered LPI and sent "Sleep" signal.

SuggestedRemedy

Update text to include possibility to enter LPI mode also when Link Partner has entered LPI mode

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The text needs to clarify that the transition to LPI state can occur in transmit and receive directions.

The editor will change the text appropriately.

Cl **55** *SC* **55.1.3.1** *P* **116** *L* **11** # 311

Parnaby, Gavin Solarflare Communica

Comment Type **E** *Comment Status* **A** *Late email*

The PMA supports both a low power idle transmit state and a low power idle receive state. The current statement suggests there is only one PMA low power idle state.

SuggestedRemedy

Change the text to '...the PMA supports a low power idle transmit state and a low power idle receive state.'

Response *Response Status* **C**

ACCEPT.

The editor will rewrite the text to make the transmit and receive states clear.

Cl **55** *SC* **55.1.3.3** *P* **116** *L* **24** # 155

Tidstrom, Rick Broadcom

Comment Type **T** *Comment Status* **A**

The following sentence is vague with regards to how many LP_IDLE codewords are required for a transition to Low Power Idle:

"In the transmit direction the transition to the LPI transmit state is initiated by the reception of LP_IDLE codewords on the XGMII interface."

SuggestedRemedy

Change the sentence to define the number of LP_IDLE codewords required for a transition to LPI.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The editor will rewrite the text to make it explicit that a complete 64/65 block is required to initiate the transition.

Cl **55** *SC* **55.1.3.3** *P* **116** *L* **52** # 179

Taich, Dimitry Teranetics

Comment Type **ER** *Comment Status* **A**

Text reads:
"The MAC is responsible for controlling transitions to and from the LPI state via XGMII signaling."

MAC is only responsible for transitions to and from LPI state of the Transmit path. Receive path operational mode depends on the Link Partner Operational Mode (Normal or LPI).

SuggestedRemedy

Update text accordingly

Response *Response Status* **C**

ACCEPT.

Cl **55** *SC* **55.1.3.3** *P* **117** *L* **4** # 156

Tidstrom, Rick Broadcom

Comment Type **T** *Comment Status* **A** *55 state machine*

The senetence below indicates that the EEE Receive state machine is in the PCS.

"The EEE Receive state machine is contained in the PCS Receive function and is specified in Figure 55-TBD."

SuggestedRemedy

The EEE Receive state machine as currently defined is in the PMA sublayer.

Possible remedies:

1. Change PCS to PMA.
2. Redefine the state machine to be in the PCS.
3. The state machine location is vender determined.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Modify state diagrams as per
tidstrom_2_1108.pdf

Tellado, Jose Teranetics

Comment Type **TR** *Comment Status* **A**

Comment about editor note: Make Tq+Tr = 128. This way LPI cycle period is independent of Tr and a power of 2. Less implementation headaches. Keeps multple modems in a switch allgined (otherwise random based on LP)

SuggestedRemedy

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The editor suggests changing the allowed Tq/Tr values to the following {Tq, Tr} pairs, with Tq+Tr=128

{4,124}, {8, 120}, {16, 112}, {32, 96}

Cl **55** *SC* **55.3.2.2.21** *P* **124** *L* # 257

Tellado, Jose Teranetics

Comment Type **TR** *Comment Status* **R**

If link partner in LPI then offset by~1/2 LPI super-frame, othewise Master starts refresh cycle~1/2 frame after Quiet and Slv 1 frame after. This prevents case where both enter simultanously without knowing what LP is doing.

SuggestedRemedy

Response *Response Status* **C**

REJECT.

This comment was WITHDRAWN by the commenter.

More details are needed to support this comment and the synchronization mechanism. It is not clear what text is required in the standard to make this scheme work.

At least one synchronization proposal will be presented at the November meeting.

Cl **55** *SC* **55.3.2.2.21** *P* **124** *L* **32** # 176

Taich, Dimitry Teranetics

Comment Type **TR** *Comment Status* **A**

Editorial comment reads:
"The process by which PCS scrambler synchronization is maintained during quiet signaling has not been specified. Simple solutions would be to freeze the scramblers during quiet. [scramblers are not used for the alert sequence]."

I suspect that freezing scramblers during Quiet Time and enabling them for Refresh/Data is unnecessary transition process sophistication and can raise yet another sync concern. Typical scramblers implementation takes virtually no power, why don't we leave them running all the time, during Quiet periods as well?

SuggestedRemedy

Editor to put specific note in the text that PCS scrambler should be running constantly and not be affected by LPI mode states/transitions

Response *Response Status* **C**

ACCEPT.

Cl **55** *SC* **55.3.2.2.21** *P* **129** *L* **51** # 292

McClellan, Brett Solarflare

Comment Type **E** *Comment Status* **A**

Sentence is awkward: The SLEEP signal is signaled using 9 full LDPC frames

SuggestedRemedy

The SLEEP signal uses 9 full LDPC frames

Response *Response Status* **C**

ACCEPT.

The editor will clarify the text as suggested.
Also change to "Sleep"

Cl **55** *SC* **55.3.5.1** *P* **126** *L* # 259

Tellado, Jose Teranetics

Comment Type **TR** *Comment Status* **A**

-53dBm is too low. It's 58dB below the PBO=0 tx level and below tx PSD mask.

SuggestedRemedy

Response *Response Status* **U**

ACCEPT IN PRINCIPLE.

Replace first sentence in 55.3.5.1 by following:
During the quiet period the transmitters on all four pairs shall be turned off. Average Launch Power (as measured 28 LDPC frames after Refresh period and 28 LDPC frames before the next Refresh period on
the same lane) for each Transmitter shall be less than -41dBm. This requirement does not apply to the periods when alert signal is transmitted as defined in Clause 55.4.2.2.1

Add editors note alerting readers to look at these numbers.

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **19** # 260

Tellado, Jose Teranetics

Comment Type **TR** *Comment Status* **A**

Comment concerning Editor note: Set TBD=0. No need for extra symbols.

SuggestedRemedy

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The editor will remove the requirement.

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **23** # 299

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *Late email*

Active pair is not defined.

SuggestedRemedy

State that the active pair defines only which pair will be used for the next refresh.

[Some earlier alert proposals also used active pair to determine where the alert would appear but this is no longer the case].

Response *Response Status* **C**

ACCEPT.

The editor will clarify the text as suggested.

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **24** # 312

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *Late email*

The clause does not define what quiet means for a non-active pair.

SuggestedRemedy

State that pairs that are not transmitting the refresh signal must meet the tx power requirements of clause 55.3.5.1, except if the alert signal is being transmitted.

Response *Response Status* **C**

ACCEPT.

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **30** # 300

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **R** *55 alert*

I am concerned that receivers may synchronize training to a refresh signal which is replaced by the alert sequence. In the present proposal alert is pam-2, but not precoded, and therefore cannot be used to update coefficients in the same manner as the pam-2 precoded refresh signal. Therefore the alert could corrupt coefficients / timing. This is particularly a concern if the alert replaces a refresh signal. The alert is followed immediately by PAM-16 so there is little opportunity to recover the coefficients.

[however, alert corrupts only 1 pair]

SuggestedRemedy

See presentation.

Response *Response Status* **C**

REJECT.
withdrawn by commenter
No presentation was submitted

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **30** # 301

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *55 alert*

What happens if an alert occurs at the same time as a refresh on another pair? None of the proposals make clear whether this refresh is transmitted or not.

If the refresh is not transmitted, this could cause problems with adaptive filters, which are expecting valid PAM-2 precoded data at that time.

SuggestedRemedy

See presentation

Response *Response Status* **C**

ACCEPT.

Resolved by change made in response to comment #177

When an alert occurs, the refresh transmission should be halted on all lanes.

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **35** # 256

Tellado, Jose Teranetics

Comment Type **T** *Comment Status* **A** *55 alert*

Comment concerning Editor note: This is an implementation detail of the rx. Alert signal is easy to detect with very low latency. Filter/timing updates per lane are happening every 128x4 frames. Making the update a couple of frames later (<<512) will have no effect

Regarding coruption of subsequent LDPC codeword:
This is implementation detail also. We will have several Wake LDPC codewords and will be transitioning rx from LPI to normal data mode. First LDPC Frame will likely be corrupted anyway and has no unique information. See presentation

SuggestedRemedy

Response *Response Status* **C**

ACCEPT.

Editor's note will be removed.

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **37** # 313

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **R** *55 thp*

The editor's note states that the non-THP encoded signal could corrupt following symbols.

If we require that the delay line of the THP is initialized appropriately then this problem goes away. [this initialization is required during link training so the capability already exists].

SuggestedRemedy

Require that the delay line of the THP is initialized during the alert signal.

Response *Response Status* **C**

REJECT.

Issue gets resolved by change made to resolve comment #177

Cl **55** *SC* **55.3.5.2** *P* **126** *L* **40** # 302

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *55 sync*

This paragraph is vague.

Imprecise synchronization could limit power savings opportunity, make testing more difficult and cause interoperability problems.

See also items 4) and 5) on page 128

SuggestedRemedy

Use the synchronization scheme proposed in presentation submitted to the November meeting.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

See response to comment # 310

Cl **55** *SC* **55.3.5.2** *P* **128** *L* **12** # 303

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *Late email*

Editor's note recommends that we require LPI capable PHYs to support the long LFSR PAM-2 training sequence.

This seems sensible, as it reduces the number of options in the standard.

SuggestedRemedy

Make it a requirement that LPI capable PHYs support the long LFSR PAM-2 training sequence.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The editor will add a requirement that EEE capable PHYs shall support the long LFSR PAM-2 training sequence after initial training. The long LFSR training sequence will be used for refresh signals during the LPI state. It is not a requirement that EEE capable PHYs use the long LFSR sequence during initial training.
The long LFSR sequence starts at the PAM2/PAM16 boundary for cases where the long LFSR sequence is not used during startup.

Cl **55** *SC* **55.3.5.2** *P* **128** *L* **16** # 157

Tidstrom, Rick Broadcom

Comment Type **T** *Comment Status* **A**

In the Edititor's notes, the following question is asked:

"Do we need a test mode, and what should be tested?"

SuggestedRemedy

Currently, there are three test mode bits, and 8-modes defined. If test modes are required for EEE, then another test mode bit will need to be added.

Response *Response Status* **C**

ACCEPT.

If we need extra test modes then we need other test mode bits.

At least one presentation on test modes will be made at the November meeting.

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *Late email*

tx_lpi_state_active should be defined more rigorously.

When does the LPI state start and end ?

SuggestedRemedy

Define that the LPI state begins immediately after the sleep finishes and lasts until the alert is sent (on the tx side) / detected (on the rx side).

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Editor will clarify that the LPI state begins immediately after the sleep finishes and lasts until the alert is sent completely (on the transmit side) and on the receive side lasts from when the sleep is detected until the alert is detected.

Cl **55** *SC* **55.3.5.2** *P* **139** *L* # 310

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *55 sync*

Proposed Figure 55-19

With the current state machine the sleep signal could be sent for 9 or 10 frames [since up to 1 complete frame could be transmitted in state TX_NORMAL].

The last sleep frame may not be detected by the PCS if it powers down the PMA as soon as it detects sleep.

If the end of the sleep signal is used to time refreshes then this ambiguity needs to be eliminated. There is still an ambiguity if the start of the sleep signal is used to time refreshes.

SuggestedRemedy

Use the synchronization mechanism described in the submitted presentation.

If the synchronizatioin mechanism depends on timing based on the sleep signal then this problem needs to be solved another way.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Change the synchronization mechanism as per parnaby_1_1108.pdf

Grimwood, Michael Broadcom Corporation

Comment Type **TR** *Comment Status* **A** *55 sync*

As pointed out in the editor's comment number 4): "If both PHYs enter LPI at the same time, how do they resolve who was the first to enter LPI in order to ensure appropriate synchronization of refresh periods? This seems to require additional signaling."

This is a critical issue to resolve. Also we need to not only resolve the "first to enter" issue, but also ensure a mechanism exists to synchronize and align refresh periods for each of the respective link partners.

SuggestedRemedy

The details for resolution of this issue to be submitted in a presentation for the November Plenary meeting.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **R** *55 timer values*

According to this text, lpi_wake_time is chosen from 1 to 9 PHY frames.

I think we need to look closely at this requirement, to ensure that in the worst conditions PHYs are able to return to an error free PAM-16 data mode after the wake frames, without compromising PHY and system power savings.

The exact requirements for this parameter are dependent on Tq/Tr/ frequency drift limits.

SuggestedRemedy

Increase the number of frames allowed for the wake time.
Exact number TBD, needs more discussion.

A presentation will be submitted for the November meeting.

Response *Response Status* **C**

REJECT.
No presentation submitted by presenter.
Withdrawn by presenter

Cl **55** *SC* **55.6.3** *P* **146** *L* **39** # 196

Grimwood, Michael Broadcom Corporation

Comment Type **TR** *Comment Status* **A** *55 timer values*

The 100BASE-TX and 1000BASE-T EEE specifications include an overall maximum PHY wake time (30 us for 100BASE-TX and negotiated up to 16 us for 1000BASE-T). There is no equivalent specification for 10GBASE-T EEE.

Instead, for 10G, there is an lpi_wake_time negotiated in the range of 1 to 9 frames. However, this is not the actual wake time (Tw_phy as defined in Clause 78) as it is only a portion of the overall wake time. The Tw_PHY time and associated requirement needs to be explicit to ensure implementations meet this overall PHY wake time requirement and also to make Tw_PHY explicit for system-level implementations.

SuggestedRemedy

Add a requirement for Tw_PHY for 10GBASE-T. The details and values for this requirement to be submitted in a presentation for the November Plenary meeting.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Follow proposed changes/additions on slide 5 of grimwood_03_1108.pdf. Leave the exact naming of the terms to the discretion of the editor.

Comment Type **T** *Comment Status* **A**

Clause 70 defines 1000BASE-KX PMD sub-layer but the LPI Transmit state diagram (Figure 70-1) includes PCS layer functions such as low power idle encoding. The definition of these functions is misplaced and should be properly described in Clause 36 (the subject of a different comment). The functions defined in this clause should be limited in scope to the PMD-level functions. PCS state information required to the implement PMD functions, and vice versa, should be communicated to the PMD using service interface primitives.

It is imperative to preserve the IEEE 802.3 layering model. In the future, it is likely that additional 1000BASE-X PMDs will be amended to support EEE. It is wasteful to repeat the definition of the PCS low power idle encoding for each PMD, and potentially disasterous if the definitions are inconsistent.

SuggestedRemedy

A proposal will be made to the Task Force illustrating the layer model and modifications required to adhere to the layer model (tentatively named healey_02_1108.pdf).

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

Referring to Table 39-1, the term "signal_detect assertion threshold" is not used hence the reference is ambiguous. In addition, "signal_detect deassertion threshold" is not a term used in Table 39-1 and constitutes another ambiguous reference. Finally, Table 39-1 defines what one might interpret to be the thresholds in terms of the 1000BASE-CX minimum differential sensitivity which has no comparable value in 1000BASE-KX. Should the -CX value be used?

The cross-reference to Table 39-1 does not appear to be adding any useful information. Define the signal_detect assertion and de-assertion criteria for Energy Efficient Ethernet directly in 70.6.4a.

SuggestedRemedy

Remove cross reference to Table 39-1 and specify the assertion/de-assertion criteria in this subclause.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Editor needs recommended text to specify assertion/de-assertion criteria for PMD signal detect here. In the absence of specific values, table will be filled with TBDs.

Remove cross reference to Table 39-1

Cl **70** *SC* **70.6.5** *P* **151** *L* **36** # 78

Healey, Adam LSI Corporation

Comment Type **T** *Comment Status* **A**

The wake-up time for the 1000BASE-KX receiver is dependent on the time required to activate the far-end transmitter. Furthermore, the receiver should have some assurance of a compliant input signal upon which to base timing recovery and adaptive equalization (if included). Neither of these aspects of transmitter behavior are currently defined in the draft.

SuggestedRemedy

Specify that the transmitter:
1. Shall deliver a signal that will assert signal detect within TBD1 us following transmitter activation
2. Shall deliver a fully compliant 1000BASE-KX signal within within TBD2 (> TBD1) us following transmitter activation

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

This may not belong in 70.6.5, but certainly within 70.6. Editor will propose new text in an appropriate section following framework in healey_02_1108.pdf

Comment Type **TR** *Comment Status* **R**

What is the idea behind introducing the concept (of asynchronous, symmetric)? If it is relevant it would be under the scope of Control Plane, which will trigger and stop LPI.

SuggestedRemedy

Perhaps can be added as an Optional Control Plane behavior in a separate Appendix section. Further a symmetric behaviour could be better described as a scheme where both partners enter LPI (may not be at the same time) and contrary for asymmetric (If there is no relation that with both going into LPI simultaneously would cause a different behaviour other than the what is specifed in the draft elsewhere)

Response *Response Status* **U**

REJECT.

Symmetric and asymmetric modes of operations are different in their nature.

When both link partners can only enter Low Power Mode simultaneously, this mode is called symmetric. That is, after link partner-1 indicates that it is ready for Low Power Mode (by sending LP_Sleep codeword), it has to wait for link partner-2 to do the same before both can enter Low Power Mode.

On contrary, when asymmetric mode is supported, link partner-1 enters Low Power Mode immediately following LP_Sleep codeword transmission, while link partner-2 can still stay in normal operational mode.

Suggest commenter contacts Dimitry Taich to discuss this

This subclause is said to define certain codewords and signals. It would be nice to provide a reader with references to locations where they are defined / described.

SuggestedRemedy

As per comment

Response *Response Status* **C**

REJECT.

Comment is not clear. It is about of referencing reader to the associated subclauses where 78.2.2 definitions appear first?

Cl **78** *SC* **78.2.3** *P* **191** *L* **37** # 322

Parnaby, Gavin Solarflare Communica

Comment Type **T** *Comment Status* **A** *Late email*

Tw_Phy as defined does not match the description in Clause 55.

The first idles transmitted on the MDI do not indicate that real data is capable of being transmitted. My understanding was that the first idles are the wake signal, during which time it is guaranteed that idles are transmitted by the MAC and no data may be sent.

Also, in clause 55, the wake time is defined as the time the wake signal is sent.

Why does the definition here include the MDI interface?

SuggestedRemedy

Define Tw_PHY as the time between IDLE appearing on the XGMII interface and when the the first codewords on the XGMII are guaranteed to be received by the remote PHY, assuming error-free operation.

Clarify definition of wake time / phy wake time.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Agree in general, Tw_PHY should be defined as period of time between reception IDLE signal on xxMII interface and moment PHY is ready to transmit Data.

Define Tw_PHY as the time between IDLE appearing on the xxMII interface and when the first data codewords are permitted on the xxMII.

Cl **78** *SC* **78.2.4.3** *P* **194** *L* **3** # 182

GUPTA, SUJAY Infosys Technologies

Comment Type **T** *Comment Status* **R**

In each direction, the Resolved Transmit Tw_sys is the lesser of the local Transmit Tw_sys and the received
(from the link partner) Receive Tw_sys.

>> Assuming Recvd Tw_sys implies the partner may drop packets if an attempt is made to send data before the expiry of Recvd Tw_sys.
The statement here, of choosing lesser of the two, could make the peer drop packets.

SuggestedRemedy

Response *Response Status* **C**

REJECT.

Firstly, there is no remedy.

The receive Tw_sys that each LP sends to its peer is a request. Both link partners know how the negotiation will resolve in both directions, therefore if a device understands that its LP will send data after a certain delay then it can choose a sleep mode that wakes in the appropriate time to avoid packet loss.

The standard requires that all devices have the ability to wake in the minimum time, negotiation to a longer wake-up time must be limited by the least capable device.

Comment Type **T** *Comment Status* **A** *Late email*

The sentence regarding refresh duty cycle changes is very vague.

What is 'reasonably sure'?

In 10GBASE-T the timing of this parameter change is critical.

SuggestedRemedy

Clarify when the parameter change takes place on the link; is it only after a link retrain?

If there is another case, it may be problematic to time the change on both sides of the link.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Paragraph 78.4.2.5 will be modified as following:

1) Sending 4 LLDP frames will be a mandatory requirement
2) Systems shall not initiate transition to LPI state within a 10sec period following sending or receiving LLDP frames that change any LPI parameters.
3) LLDP frames with parameter change requests can be sent during active period only
4) It will be clarified that LPI request within a 10sec period after an LLDP request will use the prior set of parameters that is in place.

The earlier part of the paragraph recommends sending at least 4 LLDP messages to ensure that the link partner has received them.

Also, none of these parameters have any effect unless LPI is being asserted therefore it seems clear that the new parameters will be used during the next assertion of LPI. LLDP messages cannot be sent when LPI is being asserted.

Diab, Wael Broadcom

Comment Type **E** *Comment Status* **A**

Font on the TF Chair and Editor seems to be smaller and different than WG officer names.

SuggestedRemedy

Please adjust font to match list above

Response *Response Status* **C**

Amendement

SuggestedRemedy

Amendment
Also at line 30, change 'a amendement' to 'an amendment'
At line 30, extra comma 'clause, Clause 78, which'
Broken link 'Clause 78'
Line 22, too many capitals:
Media Access Control parameters, Physical Layers and management parameters for Energy-Efficient Ethernet

.Section

SuggestedRemedy

Section
Line 12, Gb/s split over a line break. There's a Frame option to stop this.
Line 18, change 'of the IEEE Std 802.3 standard with' to 'of IEEE Std 802.3 with'
Line 24, change 'operation point-to-multipoint' to 'operation on point-to-multipoint'

Response *Response Status* **C**

ACCEPT.
