Brown, Matt Applied Micro (AMCC)

Comment Type **T** *Comment Status* **D**

As defined bit 1.147.0 determines whether fast retrain is enabled or not via the lpi_fr_en variable. However, the lpi_fr_en is to be set based on the result of auto-negotiation not explicit configuration by station manager. AN will enable fast re-train if the local (7.32.1) and the received (7.33.1) fast re-train ability are both equal to 1.

The intent of this bit was to enable the station manager disable fast retrain if it had been enabled by auto-negotiation.

Make it clear that this bit enables fast re-train only for PHYs which support fast re-train. In other, the bit can enable fast retrain only if auto-negotiation has enabled fast retrain.

SuggestedRemedy

For PHYs that support fast re-train, this bit maps to lpi_fr_en as defined in 55.4.5.1.

Also, change the definition of lpi_fr_en on page 211 line 25 to:
Set TRUE if 1.147.0 is set to 1 and fast retrain resolved during auto-negotiation (i.e., fast re-train is supported), otherwise set FALSE.

Comment Type **TR** *Comment Status* **X**

Figure 49-17.

Transition from RX_SLEEP to RX_QUIET is based upon signal_ok which is implicitly based upon PMA clock lock and PMD energy detect. Since energy_detect is reliable only during the ALERT signal and may be sporadic while a data signal is received, it is possible for transitions to cycle between RX_SLEEP and RX_QUIET.

Note also that the signal_ok parameter generated by the PMD (Clause 51) is not explicitly defined. See 51.2.3.

SuggestedRemedy

In section 51.2.3, specify that signal_ok is not to be based upon energy_detect. This clarification may have to be propagated to each PMD.

Horner, Rita Avago Technologies

Comment Type **TR** *Comment Status* **D**

The conversion of LPI control code (lp_idle) for 10GBASE-R from 0x07 (that had been set ever since Pre D1.0 and all the way until D2.2) to 0x06 is impacting multiple ICs that are in production. This change of lp_idle to 0x06 will cause error conditions and will not allow interopability with existing products. There are no other character types such as start, terminate, etc. that have matching codes, why there needs to be a last minutes change of control code that is impacting many IC interop capabilities.

SuggestedRemedy

Switch back to the original lp_idle=0x07

Proposed Response *Response Status* **O**

Cl **49** *SC* **49.2.6** *P* **162** *L* **2** # 30
Brown, Matt Applied Micro (AMCC)

Comment Type **T** *Comment Status* **D**

Paragraph implies scrambler bypass is perpetually enabled during EEE. Also, this is a really long sentence

SuggestedRemedy

To aid block synchronization in the receiver for EEE capability when Clause 74 FEC is in use, the PCS shall bypass the scrambler when scrambler_bypass is TRUE. During scrambler bypass, the PCS shall pass the unscrambled data from the scrambler input rather than the scrambled data from the scrambler output and the scrambler shall continue to operate normally.

Proposed Response *Response Status* **O**

Cl **49** *SC* **Figure 49-17** *P* **173** *L* # 77

Horner, Rita Avago Technologies

Comment Type **TR** *Comment Status* **X**

There is no way for a FEC enabled design to achieve rx_block_lock since the FEC Scrambler is always active. Disabling the scrambler in Clause 49 feeds constant data to the FEC, but the FEC's data scrambler (pn-2112) will scramble the data preventing a constant, predictable pattern from being transmitted.

SuggestedRemedy

1) Add scrambler bypass in the FEC mode by changing Figure 74-5 in clause 74 to match the changes that were added to Figure 49-5 for EEE, this reflects the scrambler bypass mode option.

2) Change the existing D2.3 references to scrambler_bypass to scrambler_bypass_tx (sections 49.2.13.2.2 Variables and 49.2.13.3 State diagrams i.e. Figure 49-16)

3) Create a new entry for scrambler_bypass_rx in the section 49.2.13.2.2 Variables

4) And insert the following in the state diagram in Figure 49-17:

RX_SLEEP
rx_lpi_active <= true
scrambler_bypass_rx <= false
start rx_tq_timer

RX_WAKE
rx_mode <= DATA
scrambler_bypass_rx <= scr_bypass_enable

start rx_rw_timer

RX_WTF
scrambler_bypass_rx = scr_bypass_enable
start rx_wf_timer

Brown, Matt Applied Micro (AMCC)

Comment Type **TR** *Comment Status* **X**

energy_detect does not necessarily indicate a good signal when TRUE nor a bad signal when FALSE. Instead TRUE indicates reliable detection of ALERT signal and FALSE means that ALERT signal is reliably not detected.

SuggestedRemedy

Simplify the definition of this parameter in section 51.2.6.1 to indicate simply that it reflects the signal_ok parameters from the PMD SI.

The definition of signal_ok in Clause 72 will have to be modified to clearly state the indended behavior for LPI mode. Another comment is submitted to request this change to sub-clause 72.6.4.

Proposed Response *Response Status* **O**

Cl **51** *SC* **51.8a.1** *P* **179** *L* **47** # 41
Brown, Matt Applied Micro (AMCC)

Comment Type **TR** *Comment Status* **X**

This section relates directly to PMD service interface parameters which are defined in the respective PMAs. No need to re-define here. PMD_SIGNAL.indication(signal_detect) primitive is already defined for non-EEE PHYs and energy detect is specified for the PMA SI in the previous section.

SuggestedRemedy

Replace text of 51.8a.1 with the following:
The following primitives are provided on PHYs that support EEE on the PMD service interface.
PMD_RXMODE.request(rx_mode)
PMD_TXMODE.request(tx_mode)
These primitives are specified in the respective PMD clauses.

Brown, Matt Applied Micro (AMCC)

Comment Type **T** *Comment Status* **D**

Figure 55-16a.

The RX_WE state was to set the value of two variables and immediately transition to the RX_E state. However, by convention, the transition to RX_E may not occur until the next 64B/65B block is received. 802.3-2008 Section 4 55.3.5.4 on page 484 says that there is "exactly one transition for each receive block processed". This means that without specifying otherwise, the RX_WE state persists for one block cycle and one block of data is ignored.

SuggestedRemedy

Import the following paragraph from 802.3-2008 Section 4 on page 484...
"The 64B/65B Receive state diagram shown in Figure 55–16 controls the decoding of 65B received blocks. It makes exactly one transition for each receive block processed."
and amend as follows...
"The 64B/65B Receive state diagram shown in Figure 55–16 controls the decoding of 65B received blocks. It makes exactly one transition for each receive block processed<, except for the transition from RX_WE to RX_E which occurs immediately after the RX_WE processes are complete>."

The editiong instruction is "Insert the following text after the existing text in 55.4.2.2 PMA Transmit function:"
Since this is all inserted text it should not be shown in underline font.

SuggestedRemedy

Remove the underline from the second and third sentences

Proposed Response *Response Status* **O**

Cl **55** *SC* **55.4.2.2** *P* **208** *L* **35** # 20

Grimwood, Michael Broadcom

Comment Type **T** *Comment Status* **D**

There is a cut-and-paste typo in the description of the link failure signal. Also, clarify that the other pairs transmit quiet (as was done for alert).

SuggestedRemedy

"The link failure signal is transmitted on pair A when the PHY operates as a MASTER. The alert signal is transmitted on pair C when the PHY operates as a SLAVE."

To:

"The link failure signal is transmitted on pair A when the PHY operates as a MASTER. The link failure signal is transmitted on pair C when the PHY operates as a SLAVE. All other pairs transmit quiet as described in subclause 55.3.4a."

Comment Type **T** *Comment Status* **X**

lpi_fr_en should be TRUE only if 1.147.0 is 1 and fast retrain was resolved during auto-negotiation and FALSE otherwise.

SuggestedRemedy

Change the definition of lpi_fr_en to:
Set TRUE if 1.147.0 is set to 1 and fast retrain resolved during auto-negotiation (i.e., fast re-train is supported) and is otherwise set to FALSE.

Change the definition of MDIO bit 1.147.0 on page 115 line 40 to:
For PHYs that support fast re-train, this bit maps to lpi_fr_en as defined in 55.4.5.1.

Proposed Response *Response Status* **O**

Comment Type **TR** *Comment Status* **X**

Figure 55-24
In PMA_Coeff_Exch state tx_mode set to SEND_T after coefficients are exchanged.
A new state can be created to initialize fast training state.

SuggestedRemedy

Create new state between PCS_Data and PMA_Coeff_Exch called FR_INIT.

Create transition from PCS_Data to FR_INIT on condition fast_retrain_flag.

Create transition from FR_INIT to PMA_Coeff_Exch on condition UCT.

Insert the following assignments in state FR_INIT and delete them from PMA_Coeff_Exch:
tx_mode = SEND_T
fast_retrain_flag = FALSE

Proposed Response *Response Status* **O**

transmitter does not power down when tx_mode is ALERT

SuggestedRemedy

change specification to ...
"When tx_mode is QUIET, the PMD transmit function may deactive functional blocks to conserve energy. When tx_mode is DATA or ALERT, the PMD transmit function operates normally."

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.11.2.3** *P* **239** *L* **31** # 17

Pillai, Velu Broadcom

Comment Type **T** *Comment Status* **X**

When tx_mode is QUIET or ALERT, the PMD Transmit function may deactivate functional blocks to conserve energy. When tx_mode is DATA, the PMD Transmit function operates normally.

PMD cannot be in energy saving while tx_mode is in ALERT.

SuggestedRemedy

When tx_mode is QUIET, the PMD Transmit function may deactivate functional blocks to conserve energy. When tx_mode is ALERT, the PMD Transmit function is expected to transmit the alert pattern. And when it is DATA, the PMD Transmit function operates normally.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.2** *P* **237** *L* **11** # 64

Brown, Matt Applied Micro (AMCC)

Comment Type **TR** *Comment Status* **D**

The intent of the ALERT signal is to provide a signal that permits reliable discrimination from noise. In addition to setting the pattern to repeating 0xFF00, disable equalization and set to maximum swing.

SuggestedRemedy

Add the following text:
When tx_mode is ALERT, transmitter equalization is disabled and the amplitude is set to maximum. This setting is equivalent to the PRESET state specified in 72.6.10.3.4. When tx_mode is DATA, the driver coeffcients are restored to their states resolved during training.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.4** *P* **237** *L* **22** # 69

Brown, Matt Applied Micro (AMCC)

Comment Type **T** *Comment Status* **D**

On EEE capable PHYs in LPI mode, signal detection is used to detect the presence of the ALERT signal.

SuggestedRemedy

On line 22 replace "when to ext Low Power if EEE is implemented" with "when the ALERT signal is detected indicating the begining of a REFRESH or WAKE cycle."

Change the paragraph starting on line 26 to the following:
The value of the SIGNAL_DETECT is defined by the training state diagram shown in Figure 72–5 when the PHY does not support EEE or if the PHY supports EEE and rx_mode is set to DATA. When the PHY supports EEE and rx_mode is set to QUIET, SIGNAL_DETECT indicates OK when an ALERT signal specified in 72.6.2 is detected marking the beginning of a REFRESH or WAKE cycle and otherwise indicates FAIL.

Proposed Response *Response Status* **O**

Cl **72** *SC* **72.6.4** *P* **237** *L* **29** # 14

Anslow, Peter Nortel Networks

Comment Type **E** *Comment Status* **D**

This says "for 1usec before"
1usec should be "1" followed by the greek letter mu, then "s" with a non-breaking space (Ctrl space) between 1 and mu.

SuggestedRemedy

Change to "1" followed by the greek letter mu, then "s" with a non-breaking space (Ctrl space) between 1 and mu.
Also on page 245 lines 4 and 16 for "30usec"

Proposed Response *Response Status* **O**
