Berlin, Germany  
March 2015

## Purpose

- Create cabling test configurations based on TIA-162 “use cases” (deployment configurations)
- To measure Alien crosstalk using COTS (Commercial off the Shelf) Cat6 cabling in TIA-162 WAP cell configurations, referenced to 10GBT/TIA-TSB-155 crosstalk limits (Alien crosstalk adjusted for insertion loss)

# Summary

- TIA-162 WAP cabling configurations used where the length of bundling was varied from 40m to 10m towards the TR.
- Both Cross connect (3-connector) and interconnect (2-connector) TR configurations used.
- Alien Cross talk (ANEXT and AACRF) channel measurements were made using commercial off the shelf Cat 6 cabling
- Alien crosstalk adjusted for insertion loss limits applied (10GBT/TIA-TSB-155)

## **Appendix A**

- IEEE802.3 10GBASE-T / TSB-155 CHANNEL LIMITS
- In cable Performance to Cat6 Limits

- The 10GBASE-T standard includes equations to determine the amount of PSANEXT loss and PSAELFEXT that a receiver can tolerate based on the link segment insertion loss and an alien crosstalk margin computation.
- Adjusted limits: the derived PSANEXT loss and PSAELFEXT noise tolerances and the insertion loss are applied as limits in qualifying installed cabling as well as specifying new cabling.
- Alien crosstalk margin computation: Link segments that can support 10GBASE-T operation (i.e., have sufficient SNR margin) can still fail the individual pair limit lines.
- 10GBASE-T specifies an alien crosstalk margin computation to assess whether the cabling can support 10GBASE-T operation in the event that the individual pair limits are not met.
- Similar alien crosstalk margin allowances may be warranted for 2.5 and 5 GBASET.
