Comment Type ER Comment Status D	Comment Type T Comment Status D		
Sync header of all 66-bit blocks out of 256B/257B to 64B/66B transcoder are corrupted, while "rx_coded_0<1:0>" only indicates the first 66-bit block in 257b. SuggestedRemedy "it shall ensure that, for every 257-bit block within the two associated codewords, the synchronization header for all 66-bit blocks at the output of the 256B/257B to 64B/66B transcoder, rx_coded_j<1:0> for j=0 to 3, are set to 11."	The "high loss" module stressed input test sets the frequency-dependent attenuation to 13.8dB (10.25dB plus host transmitter package losses). It appears as though the current intent is that the pattern generator does not implement any form of pre-emphasis. However, based on presented simulation results (e.g., smith_3bs_01a_0915, smith_01_122115_elect), operation over high loss C2M links is expected to require pre-emphasis in the transmitter (to reduce the impact of pre-cursor ISI) in order to close the link. Therefore, the module stressed input test appears to be inconsistent with the likely		
Proposed Response Response Status W PROPOSED ACCEPT IN PRINCIPLE. Change: the synchronization header for all 66-bit blocks at the output of the 256B/257B to 64B/66B transcoder, rx_coded_0<1:0>, is set to 11 to: the synchronization header for all 66-bit blocks at the output of the 256B/257B to 64B/66B	 operation of the link, and it isn't even clear that (in the absence of a TXFIR) the 50mV eye opening can be attained for the currently described test. As shown in smith_3bs_01a_0915.pdf, a fixed TXFIR with 10% precursor pre-emphasis (i.e., [-0.1,0.9]) provides reasonable performance over a wide range of channels. SuggestedRemedy The existing description of the stressed signal generation reads: "The stressed signal is generated by adding sinusoidal jitter, random jitter, 		
transcoder, rx_coded_j<1:0> for j=0 to 3, are set to 11. 2/ 120E SC 120E.3.1.6.1 P 251 L 31 # [23] mith, Ben Inphi Corporation	and bounded uncorrelated jitter to a clean pattern, followed by frequency-dependent attenuation". It is suggested to add the following text: For high loss channels, pre-emphasis capability is likely to be required in the patter generator to meet the TP4a EH6 and EW6 specifications.		
Comment Type T Comment Status D The reference receiver currently includes a CTLE defined in 83E.3.2.1.1. Due to the increased sensitivity of PAM4 to residual ISI, an improved CTLE (that includes a low-frequency equalizer (LFEQ)) is beneficial.	Proposed Response Response Status W PROPOSED ACCEPT.		
SuggestedRemedy			
Slide 4 of smith_01_122115_elect proposes a LFEQ+CTLE with 0.5dB peaking step sizes. Results in same presentation show a typical improvement in margin of 0.5 to 1.0 dB. Current reference to CTLE defined in 83E.3.2.1.1 should be replaced by the table on slide 4 of smith_01_122115_elect. Please note that an analogous change is required for Subclause 120E.3.2.1.1, Page 252, Line 37.			
Proposed Response Response Status W PROPOSED ACCEPT IN PRINCIPLE. Bring Reference CTLE definition into 120E as new sub-clause based on 83E.3.2.1.1 and

mment Type T Comment Status D	Comment Type T Comment Status D				
The AM marker removal runs on rx_scrambled produced by the decoder block.	Bypass error indication feature is not included. This is a very useful feature to enable the				
ggestedRemedy	user to reduce latency (~25% of the FEC latency). When a link can run with an uncorrected error rate of 0 you can reduce latency by turning off the error indication				
Change "The first 2056 message bits in every 8192nd codeword is the vector" to read "Every 8192nd codewords the first 2056 bits of rx_scrambled blocks is the vector"	feature. When segments in the link aren't running at the specified limits then an uncorrected error rate near 0 can be achieved. Designs supporting 25GE and 100GE RS-				
posed Response Response Status W	FEC designs (which include this feature) would likely support it for 400G as well, so adding the specification ensures the appropriate check is done to ensure MTTFPA. Correction of				
PROPOSED ACCEPT IN PRINCIPLE.	the FEC codewords still occurs, the FEC skips buffering the data to validate that the codeword was completely fixed before passing it onto the PCS decoder. It's safe to				
Change	bypass this buffering since you're non-fixable error rate (uncorretable errors) is 0. This				
"The first 2056 message bits in every 8192nd codeword is the vector" to read	feature would be usable before bypass_correction is usable, and bypass correction is currently part of the RS-FEC's definition.				
"Every 8192nd codewords the first 1542 bits of rx_scrambled_am blocks is the vector"	SuggestedRemedy				
The change to 1542 bits comes from comment #146.	Add the following text to the end of 119.2.5.3				
	"The Reed-Solomon decoder may optionally provide the ability to bypass the error				
119 SC 119.2.5.8 P 106 L 5 # 46 vick, Jeff Avago Technologies	indication feature to reduce the delay contributed by the RS-FEC sublayer. The presence of this option is indicated by the assertion of the FEC_bypass_indication_ability variable				
	(see X). When the option is provided it is enabled by the assertion of the				
mment Type T Comment Status D	FEC_bypass_indication_enable variable (see X).				
What is the point of the scrambled idle checker? FEC statistics provide superior granularity of error rate (10b checking instead of 66b) and you need the FEC engine to be running to provide valid data to the output of the descrambler. If you can't link up a full 400G PHY, then use a PMA test pattern. (Scrambled Idle Generation is needed to enable	When FEC_bypass_correction_enable is asserted, the decoder shall not bypass error indication and the value of FEC_bypass_indication_enable has no effect.				
PCS to generate valid FEC data streams)	When FEC_bypass_indication_enable is asserted, additional error monitoring is performe				
ggestedRemedy	by the RS-FEC sublayer to reduce the likelihood that errors in a packet are not detected.				
Remove the scramble idle checker from clause 119.	The Reed-Solomon decoder counts the number of symbol errors detected on all PCS lanes in consecutive non-overlapping blocks of 8192 codewords. When the number of				
posed Response Response Status W	symbol errors in a block of 8192 codewords exceeds 5560, hi_ber shall be set to true and				
PROPOSED REJECT.	the Reed-Solomon decoder shall cause synchronization header rx_coded<1:0> of each subsequent 66-bit block that is delivered to the PCS decoder to be assigned a value of 00				
	or 11 for a period of 60 ms to 75 ms."				
This is part of the adopted baseline. The commenter needs to show consensus for this change.	Change the definition of hi_ber in 119.2.6.2.2 to read "Boolean variable which indicates				
	when the Symbol Error Rate being received has exceeded the threshold defined in 119.2.5.3 when the RS-FEC is operating in FEC_indication_bypass mode."				
	Proposed Response Response Status W				
	PROPOSED REJECT.				
	It has been shown from a technical point of view that bypass indication could be added without worry of MTTFPA concerns in sun_01_1215_logic, but have not yet seen a presentation or consensus on adding this new mode to the standard.

Comment Type т Comment Status D

Allocation for penalty (for maximum TDP) of Table 123-9 doesn't include MPI then link budget doesn't include it. As presented at SMF ad-hoc meeting (refer to http://www.ieee802.org/3/bs/public/adhoc/smf/15_12_15/mazzini_01a_1215_smf.pdf, slide 4), this should be harmonized across SMF PMD. Into same presentation (slide 8) a proposal to refer to next TIA TR-42.11 revision for LC connector return loss is given. This will allow to reduce MPI penalty over 400GBASE-FR8/LR8, assuming certain values of TX/RX reflectances. Need further discussion over LC return losses, definition of Transmitter and Receiver reflectances for FR8/LR8 (still TBD into Table 123-7 and Table 123-8), in order to define the correct MPI penalty (inside "Allocation for penalties") and power budget.

SuggestedRemedy

In Table 123-9

Change "Power budget (for maximum TDP") from 6.2dB to TBD for 400GBASE-FR8. Change "Power budget (for maximum TDP") from 8.7dB to TBD for 400GBASE-LR8. Change "Allocation for penalties (for maximum TDP)" from 2.2dB to TBD for 400GBASE-FR8.

Change "Allocation for penalties (for maximum TDP)" from 2.4dB to TBD for 400GBASE-LR8.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Add an editor's note below Table 123-9:

[Editor's note: When the penalty due to MPI has been agreed, the values in Table 123-9 will be adjusted to include this penalty.]

Mazzini, Marco		Cisco Systems	
Comment Type	т	Comment Status D	
From diaguag	iono or	courred during Dec 15th ad bee call accore Reaciver constituity is	

From discussions occurred during Dec 15th ad-hoc call, seems Receiver sensitivity is defined assuming an ideal NRZ input signal and not assuming a PAM4 ideal signal. This is not auoted into 122.8.9.

SuggestedRemedy

Change "Receiver sensitivity, which is defined for an ideal input signal" into Receiver sensitivity, which is defined for an ideal NRZ input signal into 122.8.9 and into 123.8.9.

Proposed Response Response Status W

PROPOSED REJECT.

The comment description does not correctly reflect the discussions during the SMF ad hoc on 15 Dec 2015. The consensus was that the value of 4.7 dB given in http://www.ieee802.org/3/bs/public/adhoc/smf/15 12 01/king 01 1215 smf.pdf is the difference in sensitivity between an ideal PAM4 signal and an ideal NRZ signal for the same receiver. There was also consensus that the receiver sensitivity in the P802.3bs draft would not be defined to be for an NRZ signal and that therefore 4.7 dB was not an appropriate value to use.

C/ 122	SC 122.8.10	P 180	L 25	# 58
Mazzini, Mai	rco	Cisco Systems		

Comment Type T Comment Status D

Stressed receiver sensitivity is the only parameter ensuring interoperability across different PAM4 implementation technologies. It should be defined assuming a PAM4 signal, with the right amount of stress occurring on each the three slicer levels of the PAM4 receiver DUT. It cannot be an NRZ signal.

SuggestedRemedy

Add "Stressed Receiver sensitivity is defined for a stressed PAM4 input signal", into 122.8.10 and 123.8.10.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

A complete proposal for how the stressed receiver sensitivity test will be performed is requested, including the means to ensure "the right amount of stress occurring on each the three slicer levels".

Comment Type T Comment Status D

The PCS synchronization state diagram looks for 3 bad codewords in a row to declare out of lock. There are two codewords that are interleaved to form the PCS lanes, so it is not clear what 3 codewords in a row means.

SuggestedRemedy

The suggested remedy is to go out of lock if either codewordA or codewordB is uncorrectable for 3 times in a row, not if for example A is uncorrectable 2 time along with B being uncorrectable 1 in sequence. This is to prevent burst errors from prematurely taking down the interface since the two codewords are interleaved on a 10b basis.

Make the changes to the PCS sync SM (119-12) and associated variables as detailed in gustlin_3bs_03_0116.

Proposed Response Response Status W PROPOSED ACCEPT.

Comment Type T Comment Status D

The numbering of bits for the FEC codewords is reversed from standard IEEE custom (msb first). The current description follows the precedence established by 802.3bj. But then the nubmering is reversed with a reversing function. This has led to confusion. Simplify this numbering, remove the reversal and stick with the precedence of 802.3bj without the reversal. This is also consistent with the proposed bit ordering diagram.

SuggestedRemedy

Make the changes as specified in gustlin_3bs_04_0116.

The PRBS13Q test pattern is intended to be used for PAM4 transmitter measurements in the same way that PRBS9 is used for PAM2 transmitter measurements. 120.5.10.1.2 does not require that the PRBS9 pattern generator seeds should be randomized or set to specific values. Either this requirement is unnecessary for PRBS13Q or is missing from PRBS9.

SuggestedRemedy

Table 94-11 (as referenced in the editor's note) specified a different seed per physical lane in order to avoid correlated crosstalk during receiver training. In this case, the test pattern is being used for transmitter measurements and not receiver training so the definition of the seed does not seem to be required. Remove the last sentence of the second paragraph and the editor's note.

For the current CDAUI-8 reference receiver, these values should be D_p = 2 and N_p = 13. <i>posed Response Response Status</i> W PROPOSED ACCEPT IN PRINCIPLE. Change "with the exception that the PRBS13Q test pattern is used" to "with the exceptions that the PRBS13Q test pattern, a D_p value of 2, and an N_p value of	maintaining adequate Rx sensitivity margin. SuggestedRemedy Change average receive power, each lane (min) to -7 dBm. Change receiver sensitivity (OMAinner), each lane (max) to -10.3 dBm. Proposed Response Response Status W PROPOSED REJECT. No consensus has been reached on these changes to the parameter values. Diffe values are proposed by comment #54 CI 122 SC 122.7.3 P 177 L 38 # 86 Lewis, David Lumentum Comment Type T Comment Status D As proposed in traverso_3bs_01a_1115, the -DR4 link budget can be shifted down maintaining adequate Rx sensitivity margin. SuggestedRemedy Change allocation for penalties (for max TDP) to 2.5 dB. Change power budget (for max TDP) to 5.5 dB.	erent
There may be an additional exception to the linear fit method defined in 94.3.12.5.2. That subclause specifies that the D_p and N_p values for the linear fit calculation should be 2 and 16 respectively. These may not be the correct values for CDAUI-8. <i>ggestedRemedy</i> The original premise for the D_p and N_p values is that they should span the inter-symbol interference that would be addressed by the reference transmitter and receiver. A "walk-back" effect for pre-cursor compensation must also be considered (see http://www.ieee802.org/3/maint/public/healey_1_0911.pdf). Based on this premise, the D_p value should be 1 plus the number of pre-cursor taps in the transmitter feed-forward equalizer and the N_p value should be D_p+1+N_b where N_b is the number of feedback taps from the COM calculation. For the current CDAUI-8 reference receiver, these values should be D_p = 2 and N_p = 13. <i>posed Response Response Status</i> W PROPOSED ACCEPT IN PRINCIPLE. Change "with the exception that the PRBS13Q test pattern is used" to "with the exceptions that the PRBS13Q test pattern, a D_p value of 2, and an N_p value of	maintaining adequate Rx sensitivity margin. SuggestedRemedy Change average receive power, each lane (min) to -7 dBm. Change receiver sensitivity (OMAinner), each lane (max) to -10.3 dBm. Proposed Response Response Status W PROPOSED REJECT. SuggestedRemedy Add some text to get across the message that the individual PCS lanes on the PMA service interface are comprised of an interleave of 10b RS FEC symbols from the two FEC codewords. perhaps include the disagram on slide 6 of http://www.ieee802.org/3/bs/public/15_11/gustlin_3bs_03_1115.pdf. It would also help to explain why the data from the two FEC codewords is played out in such a stange looking order. Proposed Response Response Status W PROPOSED ACCEPT IN PRINCIPLE. Change: Once the data has been FEC encoded, two FEC codewords are interleaved before the data is distributed to each PCS lane. To: Once the data has been FEC encoded, two FEC codewords are interleaved on a 10-bit
Example codewords for each code are provided in Annex 91A. To: The coefficients of the generator polynomial for the RS(544,514) code are presented in Table 119-2. Example codewords for the RS(544,514) code are provided in Annex 91A	basis before the data is distributed to each PCS lane. In addition, see the diagram as added in comment #66 which should clear up any confusion.
	Nicholl, Gary Cisco Systems
	Comment Type ER Comment Status D Bucket Add "alignment" in front of markers.
	SuggestedRemedy Change "Note that alignment marker lock is achieved before FEC codewords are processed and therefore the markers are processed in a high error probability environment" to "Note that alignment marker lock is achieved before FEC codewords are processed and therefore the alignment markers are processed in a high error probability environment Proposed Response Response Status W

Nicholl, Ga	ıry	Cisco Systems		

Comment Type TR Comment Status D

I don't think it is technically correct to include the word "two" in "within the two associated codewords" Why are there "two" associated FEC codewords? The previous part of the same sentence, only refers to the FEC decoder determinering that there are errors in a "single" FEC codeword. There is no mention of "two associated FEC codewords". [Commenter's comment. This FEC codeword interleaving really complicates the description!]

SuggestedRemedy

Change "within the two associated codewords,.." to "within the associated codeword,.."

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Change:

within the two associated codewords,

To:

within the two associated codewords (the two codewords that are interleaved together),
