Now that the publication order for P802.3bu and P802.3bv has been decided, account for any changes to the base standard made by these two additional amendments.

SuggestedRemedy

Account for any changes to the base standard made by P802.3bu and P802.3bv as well as updates to any of the earlier amendments.

Proposed Response *Response Status* **O**

Cl **00** *SC* **0** *P* **1** *L* **2** # 50

Zimmerman, George — CME Consulting, Inc./

Comment Type **ER** *Comment Status* **D**

It is likely that 802.3bu and 802.3bv, both currently in sponsor ballot will be completed prior to this standard, which has just entered working group ballot. This effects the introduction, the header and may affect updates elsewhere in the draft (unclear without substantial cross-checking).

SuggestedRemedy

Consult 802.3 leadership to estimate order of publication. Change header to add "as amended by <list of amendments to be provided by staff prior to publication>", change line 28, to include IEEE Std 802.3bu-201x and IEEE Std 802.3bv-201x. Add 802.3bu and 802.3bv summaries after 802.3bz on page 13, and before 802.3bs, as well as any other amendments deemed likely to precede 802.3bs. Update table 45-3 (P41) and editing instruction to align with 802.3bv (bit 1.22 is no longer reserved), and editor to check and update draft to align with 802.3bv and 802.3bu and any other preceding standards indicated by leadership.

Grow, Robert — RMG Consulting

Comment Type **E** *Comment Status* **D**

In publication, this is where the list of amendments and corrigenda comprising the base document being amended is listed. (See IEEE Std 802.3by page two or title page of P802.3bv/D3.0 for example.)

Based on current schedules, P802.3bs, could be be designated Amendment 10, 11 or 12. Questioning the schedule for P802.3cc when it is only at D1.0 argues against Amendment 12; and 802.3cb at the same ballot makes 10 or 11 a tossup, to the list certainly can be TBD. But, in addition, Corrigendum 1 will almost certainly be approved before this project is approved.

The SASB teleconference is 22 Sept, so if P802.3bs/D2.1 is not distributed before knowing the results, 802.3bn and 802.3bz might appropriately be 2016.

SuggestedRemedy

Could edit as in P802.3bv/D3.0 or indicate to be updated during publication preparation. If the list is added, delete the list at line 25.

Proposed Response *Response Status* **O**

The WG ballot group is now known. It is thoughtful to allow members to review the appearance of their names in case there is any error in the database.

SuggestedRemedy

Add list that the WG Chair can provide, (he will probably remind you not to duplicate officer names in the added list).

Proposed Response *Response Status* **O**

Cl **00** *SC* **0** *P* **13** *L* **6** # 177

Grow, Robert — RMG Consulting

Comment Type **E** *Comment Status* **D**

Update with current document descriptions.

SuggestedRemedy

I personally prefer adding the document list with draft numbers that were used when creating the draft in an Editor's note above this list as this is the first location where base text is drawn from preceding amendments and corrigenda. The Editor's note list on p. 32 does not provide good information for this purpose.

From my most recent review updates to the list are appropriate:
p. 12, l. 42 hopefully publication editors will correct the grammar, other projects have deleted "for" to do that in their drafts;
p. 13, l. 8 add Amendment 8 802.3bu and Amendment 9 802.3bv. Also consider adding Corrigendum 1 as it is likely to preceed approval of this project.

Proposed Response *Response Status* **O**

Cl **00** *SC* **0** *P* **32** *L* **46** # 178

Grow, Robert — RMG Consulting

Comment Type **E** *Comment Status* **D**

P802.3bp should no be longer running in parallel after September, also, it is not terribly helpful in knowing which doeuments the editors have considered in preparation of the draft.

SuggestedRemedy

Delete the editor's note, or add the list of considered published, approved and in ballot drafts.

Proposed Response *Response Status* **O**

Ran, Adee — Intel

Comment Type **E** *Comment Status* **D**

The term RS-FEC appears here (corrected and uncorrected codeword counters), but the subclause titles use "PCS FEC". "PCS FEC" also appears (as a distinct term from RS-FEC) in 30.5.1.1.17 and 30.5.1.1.18 which refer to these counters.

If "PCS FEC" is the chosen term it should be used consistently.

This applies to:
45.2.3.47e, P73 L21
45.2.3.47f, P73 L42
119.1.2, P141 L26
119A, P315 L11 and L28
120B.3.2, P332 L15
120D.3.2, P351 L21 and L22
120D.3.2.2, P352 L7, L21, L29

SuggestedRemedy

Change "RS-FEC" to "PCS FEC" in the listed places.

Grow, Robert RMG Consulting

Comment Type **ER** *Comment Status* **D**

The inserts as specified make worse the sort order mess that is currently the state of 1.4. 40GBASE terms in 2015 did not follow either the speed ordered port type list at the beginning of 1.4, nor insert after 2BASE-TL for at least the first digit being in sort order. 25GBASE terms were inserted by P802.3by before 40GBASE terms so at least the first digit of the port types somewhat sort. The insert order also violates the groupings of the current 1.4 by not inserting the interface terms together.

SuggestedRemedy

Either try to better group using existing groups (after 25G/40G with interfaces separately grouped, or at a minimum order the inserts of P802.3bs in proper letter by letter sort order (.0123456789abcdefghijklmnopqustuvwxyz) ignoring spaces and all other characters.

Comment Type **ER** *Comment Status* **D**

The basic definition is limited, and speaks only to what it is, rather than the complete function it serves - to extend the reach of the 200GMII and allow communication with 200G PHYs that use a different PCS.

SuggestedRemedy

Change the definition to
The 200 Gb/s Media Independent Interface Extender extends the reach of the 200GMII and consists of two 200GXS sublayers with a 200GAUI-n between them. It is defined as a mechanism for communication with future 200 Gigabit Ethernet PHYs that utilize a PCS sublayer other than that defined in Clause 119. (See IEEE Std 802.3, Clause 118.)

Proposed Response *Response Status* **O**

Cl **1** *SC* **1.4** *P* **35** *L* **18** # 147

D'Ambrosia, John Futurewei, Subsidiary

Comment Type **ER** *Comment Status* **D**

In the definition of the 200GMII Extender, it is noted that the 200GXS is for future 200G PHYs and is identical to the 200GBASE-R PCS. It is likely that the reader will find this definition confusing. As noted in other comment, the Extender allows communication with future 200G PHYs using a PCS different than the existing 200GBASE-R PCS. It is not intuitive to merely say that the functionality of the 200GXS is the same as the 200GBASE-R PCS. Essentially, the 200GBASE-R PCS can be configured through the appropriate registers as a 200GXS in order to implement the 200GMI Extender.

SuggestedRemedy

Modify the definitionThe 200 Gb/s Extender Sublayer (200GXS) is part of the 200GMII Extender. In functionality, it is identical to the 200GBASE-R PCS Sublayer defined in Clause 119. (See IEEE Std 802.3, Clause 118.), but must be configured as a 200GXS through optional management registers.

Healey, Adam — Broadcom Ltd.

Comment Type **T** *Comment Status* **D**

JP03A is a jitter test pattern. Such testing would be more rigorous if aggressor lanes (i.e., active lanes other than the lane under test) could transmit a more spectrcally rich test pattern while the lane under test transmits JP03A. To accomplish this, the per-lane management model used for the square wave test pattern (see 45.2.1.125) should also be applied to JP03A. A modification to the jitter specification that requires aggressor lanes to transmit "random" test patterns is the subject of a separate comment.

SuggestedRemedy

Remove "JP03A pattern enable" bit from register 1.1501 (Table 45-93). Create a "JP03A control" register modeled after 1.1510 (see 45.2.1.125) in an appropriate place within the management register space and generate a new subclause accordingly. In this register, provide lane 0 through lane 7 JP03A enable bits (the remainder are reserved). As in 45.2.1.125, state in the new subclause that "lanes for which JP03A is not enabled act as determined by other registers".

The changes to 45.2.3.1.5 shown in P802.3bs D2.0 are an extension of the changes shown in P802.3by D2.1.
However, comment #7 against P802.3by D2.1 resulted in the removal of the changes to 45.2.3.1.5 from the P802.3by draft.
See http://www.ieee802.org/3/by/public/comments/8023by_D21_comment_final_responses_by_clause.pdf#page=5
Without any changes being made by IEEE Std 802.3by-2016, there is no need for the changes shown in the P802.3bs draft.

SuggestedRemedy

Remove 45.2.3.1.5 from the P802.3bs draft (and therefore leave 45.2.3.1.5 as it is in the base standard).

Slavick, Jeff — Broadcom

Comment Type **TR** *Comment Status* **D**

With the checker board distribution of RS-symbols into PCS lanes, the PCS FEC Symbol error counters don't provide a 1-1 mapping of physical lane to counter. So you have 2 physical lanes providing error counts into the same PCS FEC lane counter. This doesn't supply the intent of the counter to assist in identifying the lanes that are running at worse SER rates then others.

SuggestedRemedy

Presentation to be supplied

Proposed Response *Response Status* **O**

Ran, Adee — Intel

Comment Type **TR** *Comment Status* **D**

This bit can be left unspecified (so that any value is allowed), but to reduce confusion it would be better to specify it. A value of 1 makes sense, as it indicates an undesirable situation.

The bit _value_ can't be "undefined" - a value of a bit is either 0 or 1.

("undefined" is sometimes used in clause 45 when a read value is irrelevant or a register is undefined, but the value of this register affects the encoding of the transmitted bit stream.)

SuggestedRemedy

Change "The value of bit 3.801.4 is undefined" to "This bit is set to one".

Alternatively, change to "unspecified" or "implementation dependent".

Proposed Response *Response Status* **O**

Cl **45** *SC* **45.2.3.47i** *P* **75** *L* **5** # 104

Slavick, Jeff — Broadcom

Comment Type **TR** *Comment Status* **D**

When defining the interval you should limit this to intervals that make sense for the FEC engine. For example for Clause 119 because there's two FEC decoders running in parallel this interval should not be an odd number since it'll be a pain to add in symbol counts for 4 or 8 of the lanes and then start the next interval with the sum of the error counts from the other lanes

SuggestedRemedy

Add the following to the definition of the register. "The least significant bit of this registers shall be ignored by by the 200G/400G PCS (119) since it operates on two codewords at a time."

Comment Type **T** *Comment Status* **D**

PMA service interface is called not only by PCS but also called by another PMA, DTE 200GXS or DTE 400GXS sublayer.

SuggestedRemedy

Change "b) PMA: …" with the following:

b) PMA: -- for primitives issued on the interface between the PMA sublayer and one of PCS, DTE 200GXS, DTE 400GXS, or another PMA sublayer that is above the PMA sublayer.

Proposed Response *Response Status* **O**

Cl **116** *SC* **116.3.2** *P* **109** *L* **15** # 195

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

DTE 200GXS and DTE 400GXS do not provide the service interface to PMA, because PMA is below DTE 200GXS and DTE 400GXS.
The upper interface of DTE 200GXS and DTE400GXS is 200GMII or 400GMII.
Only PHY 200GXS and PHY 400GXS provide the service interface to PMA above.
Also, we do not need separate prefixes. A single prefix of "PHY XS" is enough.

SuggestedRemedy

Change the definition of "c) 200GXS" and "d) 400GXS)" as follows:

c) PHY XS -- for primitives issued on the interface between the PHY 200GXS or PHY 400GXS sublayer and the PMA sublayer called the PHY XS service interface.

Proposed Response *Response Status* **O**

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

In Figure 118-1, DTE 200GXS and PHY 200GXS are not distinguished. DTE 400GXS and PHY 400GXS are not distinguished as well. Although their specifications are mostly identical, there have clear difference due to the location in the protocol stack.
I think we should not omit the prefix "DTE" or "PHY" whenever their distinction is important or effective so as to remind readers of their distinction and labeling.

SuggestedRemedy

Make the following changes in Figure 118-1:

Change the upper "200GXS" with "DTE 200GXS".
Change the lower "200GXS" with "PHY 200GXS".
Change the upper "400GXS" with "DTE 400GXS".
Change the lower "400GXS" with "PHY 400GXS".
Add "DTE = DATA TERMINAL EQUIPMENT" at the bottom.

Proposed Response *Response Status* **O**

200GXS and 400GXS must be different from 200GBASE-R PCS and 400GBASE-R PCS regarding to IS_SIGNAL.indication.
However, such a difference is not described anywhere.

SuggestedRemedy

Change the paragraph in 118.1.2 to include the exception about SIGNAL.indication.

Add a new subclause for IS_SIGNAL.indication for 200GXS/400GXS sublayer. For PHY 200GXS and PHY 400GXS, the direction of IS_SIGNAL.indication is opposite to PCS. For DTE 200GXS and DTE 400GXS, the direction of IS_SIGNAL.indication is same as PCS.

Or, add a new subclause to define the PHY XS service interface that is identical to the PMA service interface except the direction of IS_SIGNAL.indication that the PMA service interface.

When the degrade features is not-supported or enabled in the XS layer, I would think we'd want it to just echo the PCS value all the way back to the RS.

SuggestedRemedy

Add text stating tx_am_sf is a copy of rx_am_sf when degrade is not enabed or supported.

Proposed Response *Response Status* **O**

Cl **118** *SC* **118.2** *P* **128** *L* **37** # 38

Ran, Adee — Intel

Comment Type **ER** *Comment Status* **D**

This paragraph probably means to say that if FEC degrade optional feature is implemented, then:
1. The DTE XS should behave as specified in clause 119 _plus additional requirements in 118.2.1_
2. the PHY XS should behave as specified in 118.2.2

But the way it is written makes it really difficult to understand what is required, and gives no clue to that it can be used for.

In addition, it is not specified what tx_am_sf and rx_am_sf should include if the option is not implemented. It makes sense that the rx_am_sf should still forward any indication that comes from the PHY... but it's not clear from the text that this part is not optional.

SuggestedRemedy

Rewrite this paragraph in plain standard language. Make it clear what _shall_ be done when the option is implemented and when it isn't. (Sorry but I can't think of a good replacement text)

Cross reference seems incorrect - 118.3 does not mention FEC_degraded_SER_enable.

Also in 118.2.2, P129 L5.

Should it be 118.4? This subclause only lists the MDIO mapping, but does not describe the variable - the full description is only available in 45.2.4.11j.1, which is hard to find. So this cross-reference is not useful.

SuggestedRemedy

Either add the description from clause 45 to 118.4 and change the cross reference to 118.4, or point directly to clause 45, or remove the cross reference.

Proposed Response *Response Status* **O**

The text on the left says

"When the PHY 200GXS or PHY 400GXS detects FEC degrade, the signal is propagated to the adjacent PCS, which can propagate that signal as local degrade"

How can it propagate that signal?

I would expect that the PHY "adjacent PCS" (facing the partner, so that it is _not_ a part of the PHY XS) _should_ propagate a degradation detected by the DTE XS. But the signaling of that PCS is specified in 119.2.4.4 using only the variable FEC_degraded_SER (which is defined in clause 119), without any input from the PHY XS PCS. Clause 119 does not assume clause 118.

A similar problem exists in the receive direction (right side). Degradation detected by the "adjacent PCS" should be propagated to the DTE XS, but how?

Also in P129, lines 38 and 43, the text says "the adjacent PCS sublayer indicates" - how does it indicate?

It seems that some interface between the PCS in the PHY XS and the adjacent PCS (in both directions) is missing. The figure only has "200GMII or 400GMII" which does not have a way to encode the "degradation" indication.

SuggestedRemedy

For propagation in the TX direction, perhaps specify in 119.2.4.4 that the FEC_degraded_SER variable can be set and cleared not only by the conditions specified, but also by an adjacent XS in an implementation-dependent manner (regardless of whether the PCS has the feature enabled or not).

For propagation in the RX direction, perhaps specify in 118.2.2 that adjacent_pcs_local_degraded and adjacent_pcs_rm_degraded can be set and cleared by the adjacent PCS in an implementation-dependent manner.

Alternatively, add service interface primitives between the adjacent "PHY PCS" and "PHY XS" to convey this information.

Cl **119** *SC* **119.2.3.7** *P* **146** *L* **27** # 334

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

There is a reference to 82.2.3.8 which may need a maintenance.
In the second sentence of 82.2.3.8, it is written as the /T/ can occur on any octet of the XLGMII/CGMII and "within" any character of the block. This sentence is inappropriate, because it implicates that the /T/ can occur on "any bit" of the block, although the packet must be always an integer multiple of octets.
It is recommended to avoid a reference to 82.2.3.8.

The following clauses have the same problem:
49.2.4.9
55.3.2.2.12
82.2.3.8
113.3.2.2.12 (802.3bq)

SuggestedRemedy

Copy the paragraph of 82.2.3.8 here.
Remove "within" in front of "any character".
Change "XLGMII/CGMII" with "200GMII/400GMII".

Proposed Response *Response Status* **O**

Slavick, Jeff — Broadcom

Comment Type **TR** *Comment Status* **D**

Since both 96b pattern and the "24-pad bits" are fixed. Why not just state the AM is a fixed 120b pattern.

SuggestedRemedy

Change "96-bit block interleaved with fixed 24-pad bits" to read "120-bit block"

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.4.4** *P* **149** *L* **9** # 339

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **TR** *Comment Status* **D**

The first paragraph of 119.2.4.4 is not well written. It is hard to follow, because a reference to 91.5.2.6 is useless (it is so different) and there is unnecessarily detail from the third sentence.

SuggestedRemedy

Remove the two sentences "In order … 91.5.2.6", and insert a new paragraph at the beginning of 119.2.4.4 which is a modified version of the first paragraph of 91.5.2.6. Avoid a reference to 91.5.2.6. The following is an example:

In order to support deskew and reordering of the individual PCS lanes at the receive PCS, alignment markers corresponding to PCS lanes are periodically inserted after being processed by the alignment marker mapping function.
The alignment marker mapping function compensates for the operation of the symbol distribution function defined in 119.2.4.7 and rearranges the alignment marker bits so that they appear on the FEC lanes intact and in the desired sequence. This preserves the properties of the alignment markers (e.g. DC balance, transition density) and provides a deterministic pattern for the purpose of synchronization. The RS-FEC receive function uses knowledge of this mapping to determine the FEC lane that is received on a given lane of the PMA service interface, to compensate for skew between FEC lanes, and to identify RS-FEC codeword boundaries.

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.4.4** *P* **149** *L* **12** # 119

Ofelt, David — Juniper Networks

Comment Type **E** *Comment Status* **D**

Text describes the alignment marker structure for each lane and refers to the "field poisitioning identical to that defined in 91.5.2.6". It is unclear to me what that actually means- the alignment marker strucutre in that section seems to be different from what we have in 200/400GbE

SuggestedRemedy

Clarify the meaning

There is no RS-FEC sublayer in this amendment. This is part of the decoder functionality.

Also in the fifth paragraph, P162 L6.

SuggestedRemedy

Change "The RS-FEC sublayer" to "the FEC decoder", in both places.

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.3** *P* **161** *L* **52** # 34

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

"it shall ensure that (...) the synchronization header for all 66-bit blocks (...) is set to 11"

In this architecture the FEC is part of the PCS, not a separate sublayer, so the synchronization header is internal to the PCS and does not appear on any interface. Thus, the normative requirement is on unobservable behavior.

The observable behavior is that all 200GMII/400GMII blocks included in the received codeword are replaced with EBLOCK_R. The "shall" should refer to this behavior.

Similarly in the 5th paragraph of this subclause.

SuggestedRemedy

Replace this paragraph (3rd) with the following:

"If the bypass indication feature is not supported or not enabled, when the Reed-Solomon decoder determines that a codeword contains errors that were not corrected, it shall cause the PCS receive function to mark all 160 200GMII/400GMII blocks that contain data from either the uncorrected codeword or the codeword it is interleaved with, as error (set to EBLOCK_R). This may be achieved by setting the synchronization header to 11 for all 66-bit blocks created from these codewords by the 256B/257B to 64B/66B transcoder."

Replace the 5th paragraph with the following:

"If the bypass indication feature is supported and enabled, additional error monitoring is performed to reduce the likelihood that errors in a packet are not detected. The Reed-Solomon decoder counts
the number of symbol errors detected in consecutive non-overlapping blocks of 8192 codewords. When the number of symbol errors in a block of 8192 codewords exceeds 5560, the Reed-Solomon decoder shall cause the PCS receive function to mark all 200GMII/400GMII blocks as error (set to EBLOCK_R) for a period of 60 ms to 75 ms."

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.3** *P* **162** *L* **14** # 35

Ran, Adee Intel

Comment Type **T** *Comment Status* **D**

SER is not a defined acronym and "symbol error ratio" is not defined anywhere. In previous clauses, "ser" was only used in as part of variable name and in corresponding register names. Compare to 91.5.3.3, 91.6.5, 108.5.3.2 and 108.6.6.

It would be preferable to avoid using the term "symbol error ratio" and instead describe the intended functionality, as done in other features here and in the referenced precedent subclauses. The actual behavior is specified in the next paragraph anyway

SuggestedRemedy

Change
"The Reed-Solomon decoder may optionally provide a FEC degrade function with the ability to signal the presence of a degraded SER."
to
"The Reed-Solomon decoder may optionally provide the ability to signal a degradation of the received signal."

Proposed Response *Response Status* **O**

Missing 3rd sentence of the "optional feature" template for degrade_SER

SuggestedRemedy

Add the end of the paragraph that introduces FEC_degrade_SER feature. "When the option is provided it is enabled by the assertion of the FEC_degraded_SER_enable variable (see 119.3)" and remove the (see 119.3) from the next paragraph for the FEC_degraded_SER_enable

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.3** *P* **162** *L* **17** # 40

Ran, Adee Intel

Comment Type **TR** *Comment Status* **D**

FEC_degraded_SER_interval, FEC_degraded_SER_assert_threshold and FEC_degraded_SER_deassert_threshold defined here do not have default values. In addition, all three are 32-bit long.

This enables a huge number of combinations of interval and threshold values. Only a small part of these combinations makes sense; for example, any threshold larger than 544*FEC_degraded_SER_interval would be inherently invalid. Additionally, both threshold values should be less than 15*FEC_degraded_SER_interval, otherwise the indication of degradation would only occur after at least one complete codeword in the period is uncorrectable; and the assert threshold should be higher than the deassert threshold.

There should be default values for all three variables, and a recommendation for setting them together.

Also, the parameters and scenarios should be analyzed to show the mean time to assert/deassert, and check whether this feature is useful or not. I am planning a presentation for that.

SuggestedRemedy

Specify default values as follows:
- FEC_degraded_SER_interval: default 8192 (as when indication is bypass)
- FEC_degraded_SER_assert_threshold: default 5560 (MTTFPA or uncorrectable codeword concern).
- FEC_degraded_SER_deassert_threshold: default 5000 (very healthy link)

Add text to indicate that unless the threshold values are set such that the assert threshold is higher than the deassert threshold, the behavior is unspecified (or degradation always asserted - see other comment)

Add as a note (informative) that in typical use, both values should be lower than the interval value.

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.3** *P* **162** *L* **17** # 37

Ran, Adee Intel

Comment Type **ER** *Comment Status* **D**

Cross reference seems incorrect - 119.3 does not mention FEC_degraded_SER_enable.

Also in lines 19, 20, 21, 23 (other variables).

Should it be 119.3.1? This subclause only lists the MDIO mapping, but does not describe the variables. The descriptions are given only in clause 45 and are hard to find.

SuggestedRemedy

Either add the descriptions from clause 45 to 119.3.1 and change the cross reference to 119.3.1, or point directly to the relevant subclauses of clause 45, or remove the cross references.

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.3** *P* **162** *L* **17** # 103

Slavick, Jeff Broadcom

Comment Type **TR** *Comment Status* **D**

For the FEC_degrade_SER function assumed you want to assert the indicator as soon as you exceed the threshold, but clear on the first interval that's below. Also the text does not align with the MDIO registers names

SuggestedRemedy

When FEC_degraded_SER_enable is asserted, additional error monitoring is performed by the PCS. The Reed-Solomon decoder counts the number of symbol errors detected on all PCS lanes in consecu-tive non-overlapping blocks of FEC_degraded_SER_interval (see 119.3) codewords. When the number of symbol errors exceeds the threshold set in FEC_degraded_SER_activate_threshold (see 119.3) the FEC_degraded_SER bit (see 119.3) is set. At the end of each interval, if the number of symbol errors is less than FEC_degraded_SER_deactivate_threshold the FEC_degraded_SER bit is cleared. If either FEC_degraded_SER_ability or FEC_degraded_SER_enable is de-asserted than FEC_degraded_SER bit is cleared.

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.3** *P* **162** *L* **17** # 44

Ran, Adee — Intel

Comment Type **T** *Comment Status* **D**

The current "FEC degrade" function provides only a binary indication of exceeding a threshold, and its behavior depends on setting of multiple parameters. Analysis of its expected performance detailed use cases were not demonstrated.

Even if we assume stationary noise conditions, exceeding a threshold is a random event, and with settings intended to identify "degradation" this may happen occasionally in healthy links and cause false alarms. In practice noise conditions may be far from stationary and cause very erratic behavior. Accurate analysis may be impractical.

It is desirable to provide more detailed symbol error statistics that would enable online indication of received signal "health" to the link partner. Criteria for defining "degradation" can then be more robust, and this would enable various application-specific methods.

SuggestedRemedy

A detailed presentation is planned.

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.5** *P* **162** *L* **34** # 561

Wertheim, Oded — Mellanox Technologie

Comment Type **E** *Comment Status* **D**

The alignment markers removal is performed after the post FEC interleaving, and therefore it's more clear to base the description on transcoding blocks and not codewords as done in the alignment markers insertion (119.2.4.4) and depicted in figures 119-7 / 119-8.

SuggestedRemedy

Replace: "For the 200GBASE-R PCS, every 4096th codewords"
With: "For the 200GBASE-R PCS, every 81920 x 257-bit blocks (corresponds to 4096 codewords)"

Replace: "For the 400GBASE-R PCS, every 8192nd codewords"
With: "For the 400GBASE-R PCS, every 163840 x 257-bit blocks (corresponds to 8192 codewords)"

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.6** *P* **162** *L* **50** # 350

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

It is not good to call rx_xcoded<256:0> as "payload", because rx_xcoded<0> is a tag bit and the actual "payload" is rx_xcoded<256:1>.

SuggestedRemedy

Change "payload" with "received 257-bit block".

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.6** *P* **162** *L* **50** # 353

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

Descrambler is a mandatory feature for S2 of PICS, but "shall" is missing.

SuggestedRemedy

Change "is descrambled" with "shall be descrambled".

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.6** *P* **162** *L* **53** # 351

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

The descrambler in 49.2.10 descrambles only the payload of the block, whereas the descrambler in this clause descrambles the whole 257-bit block, not only the payload.

SuggestedRemedy

Replace the second sentence in 119.2.5.6 as follows:

The descrambler is identical to that used in Clause 49 excepting that the whole 257-bit block is descrambled instead of the payload. See 49.2.10 for the definition of the descrambler.

Proposed Response *Response Status* **O**

Ran, Adee — Intel

Comment Type **TR** *Comment Status* **D**

Style manual: "use of the word must is deprecated and shall not be used when stating mandatory requirements; must is used only to describe unavoidable situations"

This is a mandatory requirement, not an unavoidable situation, and it is easily verifiable.

SuggestedRemedy

Change "must" to "shall", add PICS item.

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.8** *P* **163** *L* **51** # 94

Trowbridge, Steve — Nokia

Comment Type **T** *Comment Status* **D**

There are circumstances where the Rx PCS does not insert any idles when removing AMs, e.g., when no rate matching is necessary such as delivering packets to an NPU, or when the reduction in bit-rate from rate matching exceeds the amount of space occupied by the AMs.

SuggestedRemedy

Change "The receive PCS must insert idle control characters to compensate for the removal of alignment markers" to "The receive PCS may insert idle control characters to compensate for the removal of alignment markers"

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.5.9** *P* **164** *L* **5** # 43

Ran, Adee — Intel

Comment Type **T** *Comment Status* **D**

(nonexistent subclause)

A "receive ordering" subclause and especially a matching diagram is missing here (as in Figure 91–7, Figure 108–5).

SuggestedRemedy

Create suitable figures for 200G and 400G received bit ordering and add them in a new subclause.

Proposed Response *Response Status* **O**

Proposed Response *Response Status* **O**

Cl **119** *SC* **119.2.6.3** *P* **169** *L* **1** # 67

Gustlin, Mark — Xilinx

Comment Type **T** *Comment Status* **D**

Currently the alignement marker lock SM does not continously monitor the AMs after reaching the locked state, instead lock is restarted only when 3 FEC codewords in a row are not correctable. This leaves the SM vulnerable to a case where the Ethernet signal is transported by an OTN network, and under some fault conditions on the far end of the network the AM location might change and not be detected by the reciver. This can lead to continously corrupted data being received.

SuggestedRemedy

The proposed changes to figure 119-13 are included in gustlin_3bs_01_0916. We now look for correct AMs on all lanes after lock, and if 5 are found to not match expectations (pre FEC correction) on a given lane, then lock is restarted.

Proposed Response *Response Status* **O**

Palkert, Thomas — Macom

Comment Type **ER** *Comment Status* **D**

The method of generating a PRBS31Q pattern is complex and we have seen differences in bit sequences generated between vendors. Correnct implementation of the test procedures requires that the sequence is the same across vendors.

SuggestedRemedy

To provide clarity we propose that we provide the first 50 bits of the sequence of the PAM4 signal which will ensure that various implementation are in agreement.
50 bit sequence should be sufficient to ensure correct coding. Note that the proposed solution would follow what is current done for the PRBS13Q sequence which shows the bits on page 197 line 41.

Change "towards the PCS" with "towards the RS".

Proposed Response *Response Status* **O**

Cl **120** *SC* **120.5.11.2.1** *P* **196** *L* **45** # 149

Dudek, Mike — Cavium

Comment Type **TR** *Comment Status* **D**

The JP03A test pattern is used for measuring Jitter. With this pattern on all lanes crosstalk will not appear in the jitter measurement while it will degrade the jitter in the real application. We need to create the effect of the crosstalk during these tests by having a different pattern on the lanes not under test.

SuggestedRemedy

Add a per-lane enable for this pattern (and MDIO registers to match). Section 120.5.11.1.3 (square wave test pattern) provides a template for this.

Consider doing the same for JP03B however JP03B is not presently used. If it were used (eg for measuring EOJ) then this shold be done for that pattern as well.

SuggestedRemedy

Correct to PRBS13Q

Proposed Response *Response Status* **O**

Cl **120** *SC* **120.5.11.2.3** *P* **197** *L* **44** # 150

Dudek, Mike — Cavium

Comment Type **TR** *Comment Status* **D**

There is no skew requirement between lanes for the PRBS13Q generation. Also for the type of tests that PRBS13Q is being used for(scope measurements) crosstalk from other lanes is an important factor. Providing a required pattern offset between lanes would help but this would still produce crosstalk which is locked to the pattern under test and would create deterministic effects rather than random effects with some measurements not seeing the crosstalk at all and others mis-classifying it.

SuggestedRemedy

Add a per-lane enable for this pattern (and MDIO registers to match). Section 120.5.11.1.3 (square wave test pattern) provides a template for this.

Hanan, Leizerovich — MultiPhy

Comment Type **T** *Comment Status* **D**

The SSPRQ pattern is eventualy a repeating sequence of 2^16-1 PAM4 symbols.
Pattern length is not a round power of 2, which mat complicate some implementations.

SuggestedRemedy

Pad the suggested pattern by an additional symbol, generating a 2^16 symbols length sequence.

Proposed Response *Response Status* **W**

Cl **120** *SC* **120.5.11.2.5** *P* **200** *L* **10** # 148

Dudek, Mike — Cavium

Comment Type **TR** *Comment Status* **D**

There is no skew requirement between lanes for the SSPRQ generation. Also for the type of tests that SSPRQ is being used for(scope measurements such as TDEC) crosstalk from other lanes can be an important factor. Providing a required pattern offset between lanes would help but this would still produce crosstalk which is locked to the pattern under test and would create deterministic effects rather than random effects with some measurements not seeing the crosstalk at all and others misclassifying it.

SuggestedRemedy

Add a per-lane enable for this pattern (and MDIO registers to match). Section 120.5.11.1.3 (square wave test pattern) provides a template for this.

Proposed Response *Response Status* **O**

Cl **120** *SC* **120.5.11.2.5** *P* **200** *L* **10** # 305

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

The skew requirement between lanes should be defined but not defined for SSPRQ.
It should be defined to avoid the aggressor of the crosstalk being synchronous to the lane under measurement.

SuggestedRemedy

Define the requirement for the skew between lanes.

Or, alternatively, separate the test control for SSPRQ from other test patterns and make it lane-by-lane in a similar way to Square wave testing control, which allows us to run PRBS13Q or PRBS31Q on other lanes.
Define the priority between square wave and SSPRQ.

Diagram (120B-1) can be improved to better communicate the 200GXS functionality.

SuggestedRemedy

Move the stack without the extender sublayer to the left column, and the extender sublayer based stack to the right. Move the PCS and PMA for the non-extender sublayer stack to be across from the 200GXS/PMA at the top of the Extender Sublayer Stack side. Keep the bottom PMA / PMD of both stacks in the same location.

Proposed Response *Response Status* **O**

Cl **120B** *SC* **120B.1** *P* **329** *L* **27** # 494

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

In Figure 120B-1, DTE 200GXS and PHY 200GXS are not distinguished. Although their specifications are mostly identical, there have clear difference due to the location in the protocol stack.
I think we should not omit the prefix "DTE" or "PHY" whenever their distinction is important or effective so as to remind readers of their distinction and labeling.

SuggestedRemedy

Make the following changes in Figure 120B-1:

Change the upper "200GXS" with "DTE 200GXS".
Change the lower "200GXS" with "PHY 200GXS".
Add "DTE = DATA TERMINAL EQUIPMENT" at the bottom.

Proposed Response *Response Status* **O**

Comment Type **E** *Comment Status* **D**

PCS is labeled inconsistently in Figure 120B-1.

SuggestedRemedy

Change "200 Gb/s PCS" on the left stack with "200GBASE-R PCS".

Proposed Response *Response Status* **O**

Cl **120B** *SC* **120B.1** *P* **329** *L* **35** # 170

Dudek, Mike — Cavium

Comment Type **T** *Comment Status* **D**

Although the GAUI chip to chip interface can be connected to a module (combination PMA/PMD) as shown in figures 120B-1, and 120B-2 it is not the primary target application. It would be better to show the primary target application. (Note that annex 120A does not differentiate between chip to chip and chip to module). (See also similar comment against 120D)

SuggestedRemedy

Add a PMA box to the right hand side of these diagrams between the two PMA's. The GAUI chip to chip filled in link being between the PMA adjacent to the PCS and this new PMA box. The PMA to the PMA adjacent to the PMD link should just be labelled 200GAUI-n or 400GAUI-n(neither chip to chip or chip to module) and either not filled in or maybe striped. At the end of the paragraph at line 21 add the sentences "Although the 200GAUI-8 and 400GAUI-16 chip to chip interfaces are primarily intended for connections between PMA's that are not co-located with the PMD, they can be used between any PMA's. Note that the 200GAUI-n and 400GAUI-n chip to module interfaces specified in Annex 120C and Annex 120E are intended for connection from a PMA to the PMA co-located with the PMD

Proposed Response *Response Status* **O**

Dudek, Mike — Cavium

Comment Type **T** *Comment Status* **D**

Although the GAUI chip to chip interface can be connected to a module (combination PMA/PMD) as shown in figure 120B-1, and 120B-2 (is not the primary target application. It would be better to show the primary target application. (Note that annex 120A does not differentiate between chip to chip and chip to module). (Also see similar comment against 120B)

SuggestedRemedy

The GAUI chip to chip filled in link being between the PMA adjacent to the PCS and this new PMA box. The PMA to the PMA adjacent to the PMD link should just be labelled 200GAUI-n or 400GAUI-n(neither chip to chip or chip to module) and either not filled in or maybe striped. At the end of the paragraph at line 21 add the sentences "Although the 200GAUI-4 and 400GAUI-8 chip to chip interfaces are primarily intended for connections between PMA's that are not co-located with the PMD, they can be used between any PMA's. Note that the 200GAUI-n and 400GAUI-n chip to module interfaces specified in Annex 120C and Annex 120E are intended for connection from a PMA to the PMA co-located with the PMD

Hidaka, Yasuo — Fujitsu Lab of America

Comment Type **T** *Comment Status* **D**

The electrical characteristics of test fixture was specified from 0.05GHz to 25GHz in Equation 93-1 and 93-2 in 93.8.1.1, whereas the informative channel insertion loss is specified from 0.01GHz to 28.05GHz in Equation 120D-1.
We need to expand the range of frequency of the characteristics of test fixture.

SuggestedRemedy

Insert the folllowing phrase after "Figure 93-5 and 93.8.1.1":
"with the exception of min frequency for the IL and RL specification is 0.01GHz and max frequency of the IL and RL specification is 28.05GHz".

Also, insert the same phrase after "Figure 93-10 and 93.8.2.1".

Proposed Response *Response Status* **O**

Cl **120D** *SC* **120D.3.1** *P* **348** *L* **19** # 23

Healey, Adam — Broadcom Ltd.

Comment Type **TR** *Comment Status* **D**

The steady state voltage and linear fit pulse peak parameters refer to 94.3.12.5.3. However, 94.3.12.5.3 refers to 94.3.12.5.2 which states that the linear fit pulse is derived using ES1 and ES2 as defined in 94.3.12.5.1. The ES1 and ES2 definition in 120D.3.1.2.1 should be used instead. In fact, all of the exceptions currently listed in 120D.3.1.2 should also apply to the steady state voltage and linear fit pulse peak measurements.

SuggestedRemedy

Insert a new subclause under 120D.3.1 named "Linear fit to the measured waveform" (suggest 120D.3.1.2). The contents of the new subclause include the following paragraph followed by the lettered items a) through c) from the current 120D.3.1.2. "The test procedure in 94.3.12.5.2 is followed to determine the linear fit pulse response, linear fit error, and normalized transmitter coefficient values with the following exceptions." Insert a new subclause onf 120D.3.1 named "Steady-state voltage and linear fit pulse peak" (suggest 120D.3.1.3) with the following contents: "The linear fit pulse, p(k), is determined according to the linear fit procedure in 120D.3.1.2. The steady-state voltage vf is defined to be the sum of the linear fit pulse p(k) divided by M, determined in step 3 of the linear fit procedure." Renumber 120D.3.1.2 accordingly (suggest 120D.3.3). Change the last sentence of the first paragraph of subclause to the following and remove lettered items a) through c): "The transmitter output equalization is characterized using the linear fit method described in 120D.3.1.2). Promote "Transmitter linearity", currently 120D.3.1.2.1, to the same level in the heirarchy as the other transmitter parameters (suggest 120D.3.1.4). The subclasue 120D.3.1.2.2 should be a subclause of the new 120D.3.1.4 (suggest 120D.3.1.4.1). Update all cross-references accordingly, including in Table 120D-1 where the references for steady-state voltage and linear fit pulse peak parameters should now be to 120D.3.1.3. This is expected to clearly incorporate the referenced content with all of the agreed upon exceptions.

Healey, Adam — Broadcom Ltd.

Comment Type **T** *Comment Status* **D**

It is stated that jitter measurements are performed with transmitters on all lanes enabled and transmitting the same pattern. This implies the aggressor lanes will also be transmitting JP03A. It would be better if they were transmitting a more spectrally rich pattern such as PRBS31Q. Note that the "PRBS pattern testing control" registers (see 45.2.1.124) currently do not permit mixing JP03A on one lane with different test patterns on other lanes. This is the subject of a separate comment.

SuggestedRemedy

Replace the second paragraph of 120D.3.1.1 with the following: "Jitter measurements are performed with transmitters on all lanes enabled and using identical transmitter equalizer settings. Transmitters on lanes not under test transmit PRBS13Q, PRBS31Q, or a valid 200GBASE-R or 400GBASE-R signal. PRBS13Q is described in 120.5.11.2.3 and PRBS31Q is described in 120.5.11.2.4."

Proposed Response *Response Status* **O**

Dudek, Mike — Cavium

Comment Type **TR** *Comment Status* **D**

Crosstalk from the other lanes will not create jitter if they are also transmitting the JP03A test pattern. An uncorrelated pattern is needed on the other lanes. (I have made a separate comment against clause 120 to provide individual lane enablement of JP03A)

SuggestedRemedy

Replace "enabled and transmitting the same pattern with identical transmit equalizer settings" with "enabled with the identical transmit equalizer settings and transmitting pattern 3,5 or scrambled idle"

Proposed Response *Response Status* **O**

Cl **120D** *SC* **120D.3.1.1** *P* **348** *L* **24** # 564

Dawe, Piers — Mellanox

Comment Type **TR** *Comment Status* **D**

94.3.12.7 refers to 94.3.12.5.2 which uses QPRBS13; and 94.3.12.5.1, 94.2.9.4, transmitter linearity test pattern; and runs of at least 8 consecutive identical levels.

SuggestedRemedy

Should be PRBS13Q; and PRBS13Q; and runs of at least 6 consecutive identical levels. There may be other corrections / exceptions needed.

Proposed Response *Response Status* **O**

Cl **120D** *SC* **120D.3.1.1** *P* **348** *L* **28** # 565

Dawe, Piers — Mellanox

Comment Type **TR** *Comment Status* **D**

Should not use such an unrepresentative pattern; should not require such a strange pattern for just one spec item.
Should not rely on Clause 94.

SuggestedRemedy

Either: measure EOJ with PRBS13Q (or a shorter PRBSnQ if we have one) as in D1.4 120E.3.3.2 Even-odd jitter, but with 120D style slicing levels based on 120D.3.1.2.2. Apply the spec to a subset of emphasis settings, or apply to all emphasis settings but ignore the edges that are not present when emphasis is off. This will be a by-product of the SNDR and other jitter measurement, avoiding a separate measurement.
Or, if we think that J_RMS, J5 (J4), SNDR, and linear fit components provide good enough coverage, remove the EOJ spec.
Remove the JP03B test pattern generator and registers.

Proposed Response *Response Status* **O**

Cl **120D** *SC* **120D.3.1.1** *P* **348** *L* **28** # 574

The jitter parameters CRJrms and CDJ have been replaced by J_RMS and J5. As a result, the definition of the mapping of measured jitter parameters to sigma_RJ and A_DD needs to be modified.

SuggestedRemedy

Given J_RMS and J5, specify that A_DD = ((J5/2)+Q5*sqrt((Q5^2+1)*J_RMS^2-(J5/2)^2))/(Q5^2+1). This equation assumes that the bounded uncorrelated jitter has a dual-Dirac distribution (as COM also assumes). Given J5 and A_DD, specify that sigma_RJ = ((J5/2)-ADD)/Q5. Note that Q5 is approximately 4.4172.

Healey, Adam — Broadcom Ltd.

Comment Type **T** *Comment Status* **D**

The subclause states that the test procedure for jitter tolerance is the same as the one described in 120D.3.2.1 with the exception that no broadband noise is added. In 120D.3.2.1, items c) through f) pertain to the calculation of the test channel COM but the jitter tolerance specification includes no requirement for test channel COM. It is important to state a COM requirement since there is no other guarantee that the test setup supports the target RS-FEC symbol error ratio even prior to the application of the sinusoidal jitter (insertion loss at the fundamental frequency may not be enough).

SuggestedRemedy

Require that the test channel COM, calculated per items c) through f) in 120D.3.2.1, be at least 3 dB. In addition, for the COM parameter calibration described in item d), require that the test channel transmitter J_RMS and J5 values are measured with the jitter frequency and amplitude set according to Case E from Table 120D-6.

For a high loss host output with a peak-to-peak voltage of 900 mV as measured with PRBS13Q, the peak-to-peak voltage in service will be greater, by an amout that is more than I expected. It is too much to expect the receiver designer to second-guess this; we should expect the receiver to work with 900 mV for any reasonable pattern.

SuggestedRemedy

Reduce the 900 mV here by a few percent. This makes no difference to a high-loss host. The output swing in a low-loss host might have to be reduced slightly, but that's OK, the module will still have an easier task than with the high-loss host.
Reduce the crosstalk amplitude in module output test and host stressed input calibration similarly, as they are also specified with PRBS13Q.

Proposed Response *Response Status* **O**

Healey, Adam — Broadcom Ltd.

Comment Type **TR** *Comment Status* **D**

Between P802.3bs/D1.2 and P802.3bs/D1.3, the module near-end eye height and width limits were decreased (from 120 mV/400 mUI to 90 mV/265 mUI) after a thorough investigation based on more recent assumptions of requirements (pre-cursor equalization) and device capabilities (see <http://www.ieee802.org/3/bs/public/16_03/hegde_3bs_01_0316.pdf>and follow-ons). However, the commenter is unaware of any recent verification that the host output eye requirements (50 mV/200 mUI) are achievable with a host transmitter whose capabilities are similar to the those implied by Annex 120D (chip-to-chip 200G/400GAUI-4/8) over representative host channels.

SuggestedRemedy

Verify the limits are still appropriate or adjust them accordingly. A presentation will be provided that explores this issue.

Dawe, Piers — Mellanox

Comment Type **TR** *Comment Status* **D**

This crosstalk generator is intended to represent a module, and generate broadband energy. The spec allows an implementer to achieve the letter of the spec by using a lot of emphasis but miss the intention.

SuggestedRemedy

This transition time spec should be replaced by a slew time spec, e.g. 4.5 ps between +/- 0.1 V. Definition of slew time similar to transition time but with fixed thresholds instead of the signal-dependent 20% and 80%. Same for the counter propagating crosstalk channels during calibration of the module stressed input signal (120E.3.4.1.1).
We don't need to change the spec for the crosstalk generator in the opposite direction because that's a slower signal so an implementer won't be using emphasis.

Proposed Response *Response Status* **O**

Cl **120E** *SC* **120E.3.2** *P* **366** *L* **32** # 127

Dawe, Piers — Mellanox

Comment Type **TR** *Comment Status* **D**

The module output transition time min. spec is there to protect the module's input from too much crosstalk when connected to a host with more NEXT than the MCB. "Too much" doesn't depend on the module's output amplitude setting, so we should have an absolute spec here not a relative one.

SuggestedRemedy

This transition time spec should be replaced by a slew time spec, e.g. 3.5 ps between +/- 0.1 V. Definition of slew time similar to transition time but with fixed thresholds instead of the signal-dependent 20% and 80%.
There is less need to change the transition time spec for the host output because the connector is on the host board, so the NEXT is already in the measurement.

Proposed Response *Response Status* **O**

Dudek, Mike — Cavium

Comment Type **TR** *Comment Status* **D**

The VEC spec was required in other clauses because the module output signal was being tested at the Near end and this protected hosts from modules with large amplitude outputs that were highly distorted that would be difficult to receive after a long host trace. With this clause also specifying the Far end there is no need for this specification for the Module output or having to calibrate to a specific value for the host stressed input test.

SuggestedRemedy

Delete the VEC row in Table 120E-3.

Delete the sentence related to VECP on page 370 line 5.

Delete the heading for section 120E.4.2.1, the initial sentence and Equation 120E-3 and definition of VEC, however retain the definitions of the AVupp etc.

Delete TH14 in the PICS. page 379 line 35

Proposed Response *Response Status* **O**

Cl **120E** *SC* **120E.4.1** *P* **372** *L* **35** # 86

Ghiasi, Ali — Ghiasi Quantum LLC

Comment Type **T** *Comment Status* **D**

We have inconsistency between baseline simulations and what we are referencing for MCB/HCB. The simulations were based on hypotitical connector haivng ~1/3 the crosstalk http://www.ieee802.org/3/bs/public/adhoc/elect/24Aug_15/dallaire_01_082415_elect.pdf

SuggestedRemedy

Current eye width and eye height may not be met with connectoras defined and referenced in 92.11.1 having ~3x the crosstalk. Attach presentation provide background http://www.ieee802.org/3/cd/public/July16/ghiasi_3cd_02_0716.pdf
Plan to update the presentation as ghiasi_3bs_01_0916.

Comment Type **TR** *Comment Status* **D**

The SMSR spec has been described variously as a diagnostic, a component level spec for buying lasers to make into PMDs, an early warning, a comfort blanket / included by default, or something that can be measured relatively easily in a component lab. Any SMSR problems will contribute to TDECQ - but we haven't quantified them. The effect of SMSR will depend strongly on the amount of dispersion which varies from one PMD to another and lane to lane, and on laser technology. We should not obstruct innovative implementations.

SuggestedRemedy

Make the SMSR limit a recommendation not a PICS requirement. All optical PMDs in this project.

Proposed Response *Response Status* **O**

Does the extinction ratio matter much in PAM4?

SuggestedRemedy

Unless it's important, reduce the limit to 3 dB, or as appropriate, for each optical PMD.

Proposed Response *Response Status* **O**

Cl **121** *SC* **121.7.1** *P* **218** *L* **33** # 130

Dawe, Piers — Mellanox

Comment Type **TR** *Comment Status* **D**

Now we have a TDECQ spec, we should look again at the RIN spec. The effect of RIN is included in TDECQ; the acceptable level of RIN depends strongly on other transmitter impairments. All we could *require* in a spec is the amount of RIN that would create substantially all of the TDECQ limit, which I don't think is this number. It would be hard to *recommend* any number without making assumptions on behalf of all future transmitter implementers that we can't justify.
As 52.9.6 says "This procedure describes a component test that may not be appropriate for a system level test depending on the implementation. If used..."
and "In order to measure the noise, the modulation to the DUT is turned off." A transmitter that's trying to deliver 4 well-spaced PAM4 levels can't be expected to do anything in particular if the modulation to the DUT is turned off!

SuggestedRemedy

As we no longer need a RIN spec and it would be difficult to choose a recommended value - delete the RIN22.8OMA row in Table 121-6, and in Table 121-10. Delete 121.8.7.
In 121.8.5.1 and 121.8.5.2, we could change "The state of polarization of the back reflection is adjusted to create the greatest RIN" to "The state of polarization of the back reflection is adjusted for the greatest TDECQ".
Similarly in clauses 122, 124.

Dawe, Piers — Mellanox

Comment Type **TR** *Comment Status* **D**

This SSPRQ pattern will give inconsistent results when testing a range of transmitters.

SuggestedRemedy

If we can find a less extreme pattern that better achieves the objective of allowing TDEC measurements that correlate to the TDP we don't want to measure at line rate, change to that pattern.
If we can't, use PRBS13Q, which is much more representative, for TDECQ testing. Tell the implementer to be careful about low frequency effects.
Similarly in clauses 122, 124.

Proposed Response *Response Status* **O**

Hanan, Leizerovich MultiPhy

Comment Type **T** *Comment Status* **D**

Reference equalizer implementation is not specifically stated.
This may cause several problems, especially if the reference equalizers used for Rx and for Tx are implemented differently between two different vendors, causing their modules not to interop with one another.
Bad equalizer implementation may assist modules to pass SRS on the Rx side, as the eye is seems falsely closed, altough it can be opened more using a better equalizer, while the same Rx will not pass with actual TX signals.

SuggestedRemedy

Suggest a specific reference equalizer implementation.
Possible example implementation is minimum MSE between the signal and an ideal PAM-4 signal with the same OMA as the measured signal (inner levels at 0, OMA/3 and 2*OMA/3).

Proposed Response *Response Status* **W**

Cl **121** *SC* **121.8.7** *P* **226** *L* **11** # 152

Dudek, Mike Cavium

Comment Type **TR** *Comment Status* **D**

Table 121-9 specifies that the QPRBS13 pattern is used for measuring RIN. However 121.8.7 refers to a test methodology in clause 52.9.6 that is not appropriate for use with that pattern. 52.9.6 specifies an NRZ sqare wave pattern and uses an O/E convertor AC coupled into an electrical power metter.
If a slow PAM4 pattern where used the denominator for the RIN calculation would be a factor of 2/3 smaller than with the NRZ pattern Note that the square wave pattern was originally chosen because it spends little percentage time in transitions and therefore the average power measured is close to (OMA/2) squared. Using a pattern with a lot of transitions means that the risetimes will affect the measurement.

SuggestedRemedy

In Table 121-9 Change the RIN row to say NRZ square wave. Or better create a new section for measuring RIN using scope measurements with the QPRBS13 patten by measuring the noise on the 4 different static levels of the pattern and calculating the RIN from those numbers and the OMA and remove the reference to 52.9.6

Make similar changes to the other PAM4 optical clauses.

Proposed Response *Response Status* **O**

Proposed Response *Response Status* **O**

Cl **122** *SC* **122.1** *P* **239** *L* **1** # 558

Booth, Brad — Microsoft

Comment Type **TR** *Comment Status* **D**

400GBASE-FR8 does not satisfy broad market potential or economic feasibility. It is well understood in the Ethernet industry that all solutions for 2 km optical PMDs are considered "client" or "grey" optics. These PMDs must be able to satisfy the faceplate density requirements (32 ports per 1 RU) to be considered economically feasible. The current power estimations for 400GBASE-FR8 does not permit the PMD to meet the power envelope or cost requirements needed to satisfy this requirement. Because the PMD will not be economically feasible, it is therefore unlikely to have broad market potential.

SuggestedRemedy

Two options:
1) Delete 400GBASE-FR8 from the draft and remove the objective from the project.
2) Consider other options that will result in a solution that satisfies the economic feasibility and broad market potential requirements.

As #2 is highly unlikely at this point in time, option #1 is the preferred suggested remedy.

Proposed Response *Response Status* **O**

Cl **122** *SC* **122.7.1** *P* **249** *L* **20** # 111

King, Jonathan — Finisar

Comment Type **T** *Comment Status* **D**

The current 'average power (max)' spec value for 400GBASE-FR8 and 400GBASE-LR8 would require the ER to be higher than the specified minimum for a high OMA Tx (e.g. at max Tx_OMA). Follow the precedent in Table 122-9 to allow the minimum ER to be used at the max Tx_OMA value. This will help yield and manufacturability.

SuggestedRemedy

In Table 122-10: In the 'Average power (max)' row unmerge the spec value cell and put the value 5.7 into the column for 400GBASE-FR8, and 5.9 into the column for 400GBASE-LR8

Proposed Response *Response Status* **O**

400GBASE-SR16 requires twice the number of fibers as two 200GBASE-SR4; therefore, it does not satisfy the balanced cost requirement of economic feasibility. Because the PMD does not meet the economically feasibility, it is unlikely to have broad market potential.

SuggestedRemedy

Two options:
1) Delete 400GBASE-SR16 from the draft and remove the objective from the project.
2) Modify the PMD to be 400GBASE-SR8 based on the same technology proposed for 200GBASE-SR4.

As #1 is highly unlikely at this point in time, option #2 is the preferred suggested remedy.

TIA-492AAAE wideband fiber satisfies OM4 and should be referenced

SuggestedRemedy

Add Wideband fiber of TIA-492AAAE as supported media and add a row to table 123-5:
0.5 m to 100 m for wideband TIA-492AAAE fiber.

Proposed Response *Response Status* **O**

Cl **123** *SC* **123.7** *P* **276** *L* **4** # 68

Kolesar, Paul CommScope

Comment Type **TR** *Comment Status* **D**

TIA has published TIA-492AAAE, the detailed fiber specification for what is referred to in ANSI/TIA-568.3-D as wideband multimode fiber. This fiber is compliant and superior to type A1a.3 (OM4) and will support the 400GBASE-SR16 PMD at least as well as OM4. Therefore it should be included as a recognized media type.

SuggestedRemedy

Add the fiber by replacing the second sentence of the clause as follows: A 400GBASE-SR16 compliant PMD operates on 50/125 µm multimode fibers, type A1a.2 (OM3), type A1a.3 (OM4) or cabling made with wideband fiber compliant to TIA-492AAAE, according to the specifications defined in Table 123-6.

Note: IEC and ISO are in the midst of standardizing wideband fiber and cabling. It is anticipated that IEC type designation and ISO OMx designation will be known well before the P802.3bs amendment is published. Should that come to fruition, the terminology can be made common across all three types.

Proposed Response *Response Status* **O**

Shariff, Masood CommScope

Comment Type **TR** *Comment Status* **D**

TIA-492-AAAE for WBMMF has been published since June 2016. Parallel specifications are under development in IEC 86A. TIA-568-3-D has recognized WBMMF and is on the verge of publication. ISO 11801-1 has also added this Cabling Category to the DIS standard currently under ballot.

IEEE 802.3bs should recognize this advance in MM optical fiber cabling that can support 400GBASE-SR16 at 850 nm while also enabling future windows between 850 nm and 953 nm.

SuggestedRemedy

Add 50/125 WBMMF as an option since this type of fiber will support 400GBASE-SR16

Proposed Response *Response Status* **O**

Cl **123** *SC* **123.7** *P* **276** *L* **10** # 113

King, Jonathan Finisar

Comment Type **T** *Comment Status* **D**

The TIA have published the spec for wideband MMF,we should include it in the listed media for 400GBASE-SR16.

SuggestedRemedy

Add a row for wideband MMF in Table 123-5. Add a column for wideband MMF in Tables 123-6 and Table 123-7. See presentation 'king_3bs_01_0916.

Proposed Response *Response Status* **O**

Cl **123** *SC* **123.7** *P* **276** *L* **15** # 69

Comment Type **TR** *Comment Status* **D**

TIA has published TIA-492AAAE, the detailed fiber specification for what is referred to in ANSI/TIA-568.3-D as wideband multimode fiber. This fiber is compliant and superior to type A1a.3 (OM4) and will support the 400GBASE-SR16 PMD at least as well as OM4. Therefore it should be included within the discussion of the optical fiber cable including within Table 123-7-Optical fiber and cable characteristics.

SuggestedRemedy

Wideband fiber shares core diameter, nominal wavelength, and effective modal bandwidth characteristics with OM4. It delivers no more than 3.5 dB/km attenuation (and in fact is set to 3.0 dB/km in TIA-568.3-D). However the zero dispersion wavelength and chromatic dispersion slope are both superior to the specifications for OM3 and OM4. To handle these similarities and differences, a new column is proposed to be added to the right of the "OM4" column with the heading "wideband". Superscript the heading for footnote "c", the footnote to read: TIA-492AAAE. Increment the current "c" footnote to "d". Share the cells in this column for the first four rows with those of the "OM4" column. In the ZDW cell insert the following: 1297 <= lambda0 <= 1328. In the dispersion slope cell insert the following: <= 4(-103)/(840(1-(lambda0/840)^4)).

Proposed Response *Response Status* **W**

Swanson, Steven — Corning Incorporated

Comment Type **T** *Comment Status* **D**

While it understood here are no lane assignments (within a group of transmit or receive lanes) as the PCS sublayer is capable of receiving the lanes in any arrangement.

However, when used in a breakout configuration, matching the correct Tx and Rx matters. The various lanes are landing in different transceivers, thus they cannot be reordered (they are physically in different optics).

SuggestedRemedy

Replace Figure 123-4 with a Figure that numbers the Tx positions 1-16 left to right and Rx positions 1-16 left to right.

Proposed Response *Response Status* **O**
