# **Experimental measurements showing technical feasibility for a 56Gbaud PAM4 optical link budget**

Marco Mazzini, Matt Traverso, Gary Nicholl - Cisco

IEEE P802.3bs 400 Gb/s Ethernet Task Force  
September 8-10, Ottawa, Canada

# Introduction

---

- There have been several previous presentations related to the use of 56Gbaud PAM4 (100Gb/s per channel) as a fundamental technology for addressing one or more of the 802.3bs SMF objectives.
- This presentation focuses on validating the technical feasibility of a 56Gbaud PAM4 optical link model, through experimental measurements.
- The experimental setup used to obtain these results is not intended to be an implementation proposal.

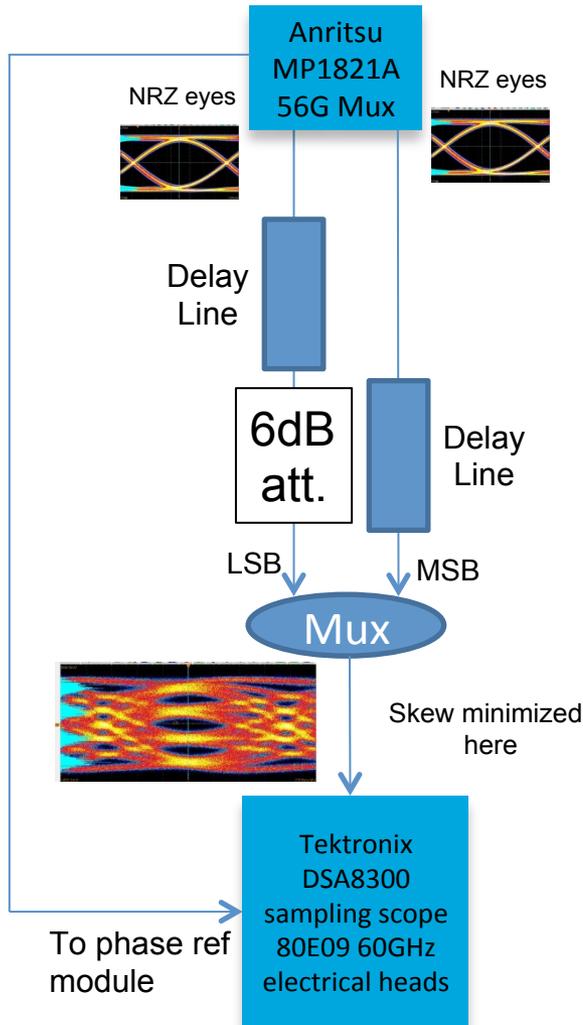

# Scope of this work

---

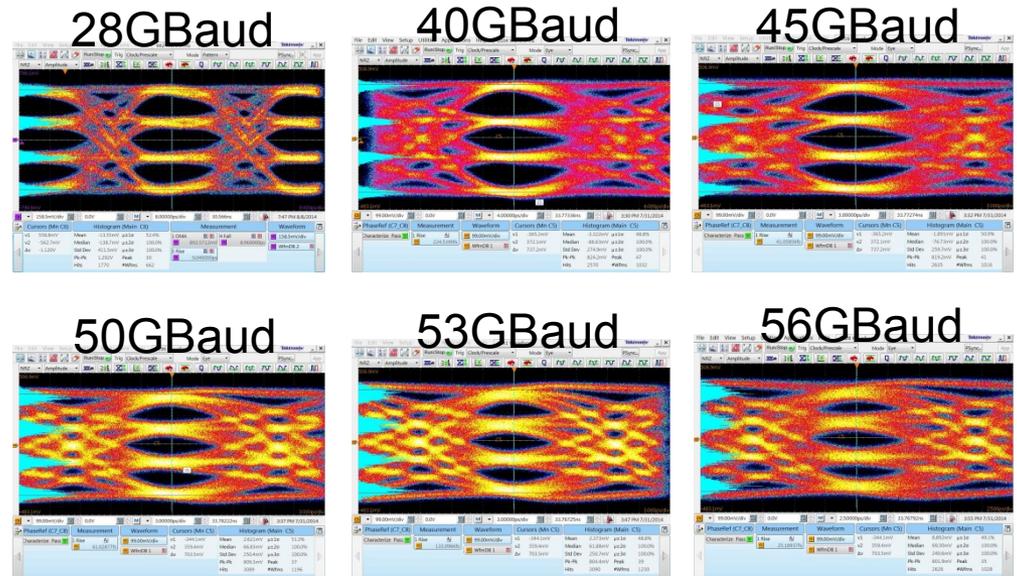

Verify technical feasibility of 56G PAM4 (>100Gb/s each) and proposed link budget.

- Understand pre-FEC limits over:
  - 2 km link (objective on Duplex SMF).
  - Up to 56 Gbaud (PAM4) on optical lanes.
- Steps followed:
  - Built PAM4 (up to 56GBaud) electrical generator.
  - Emulate PAM4 (up to 56GBaud) optical link.
  - Acquire waveforms, run post-processing.

# PAM-4 Electrical Test Setup

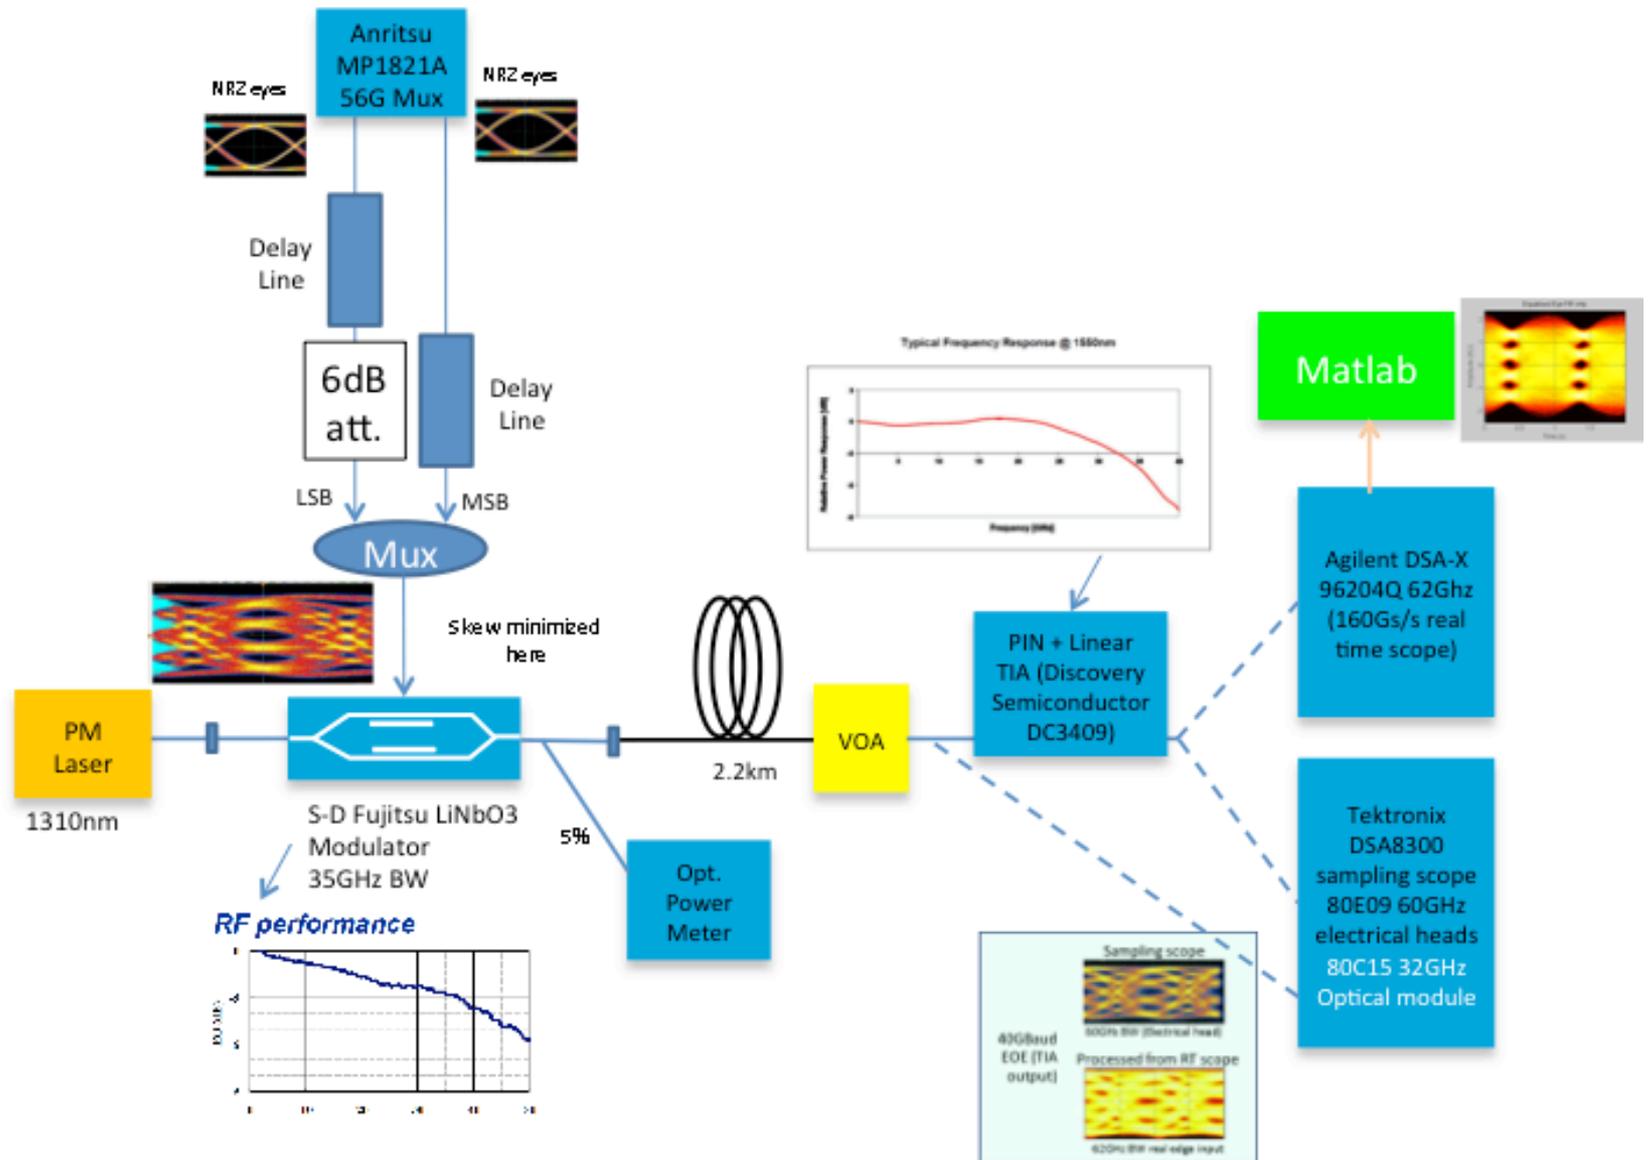

## PRBS31 electrical eyes

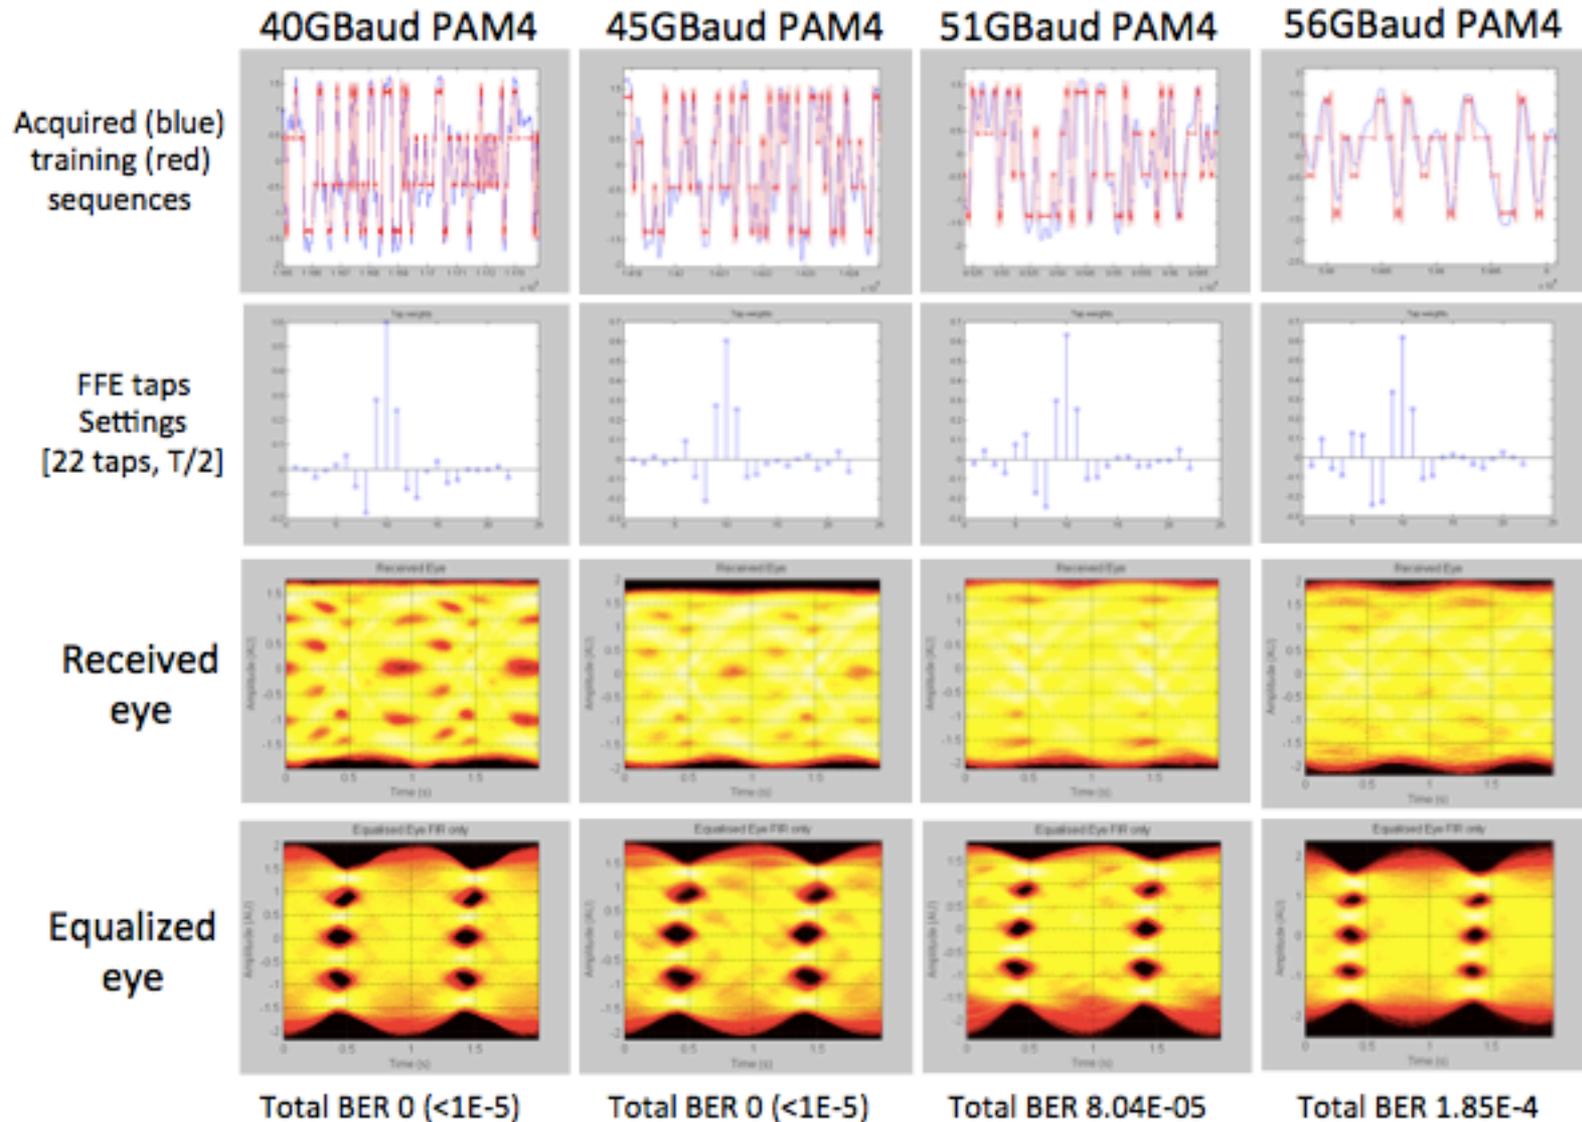

Increasing the bit rate RN also DN contribution (ISI due to BW limitations) increase.

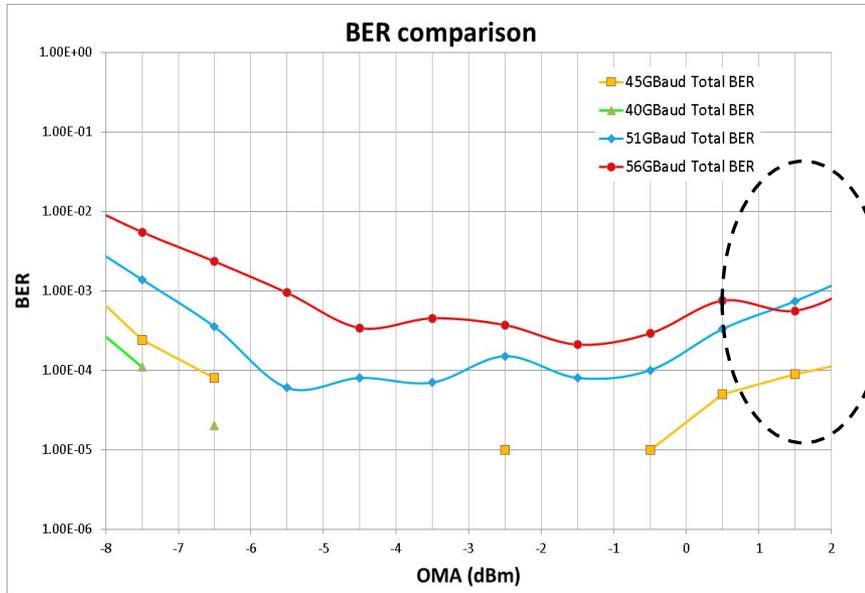

# PAM-4 Optical Test Setup

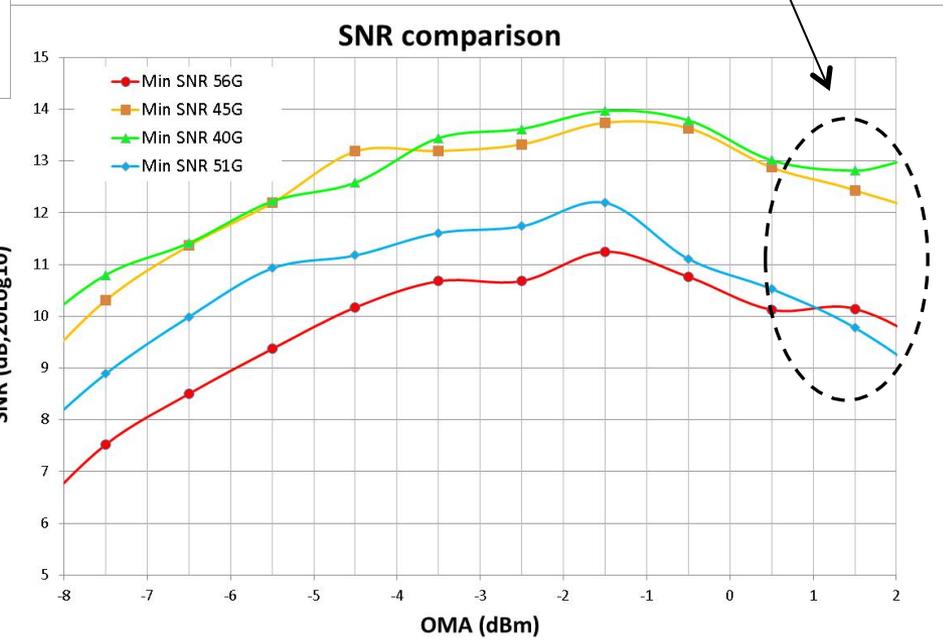

# Processing at different rates (-3dBm I/P power)

# SNR and BER 'versus' data rate and OMA

Degrations due to PIN TIA overload distortion (see backup)

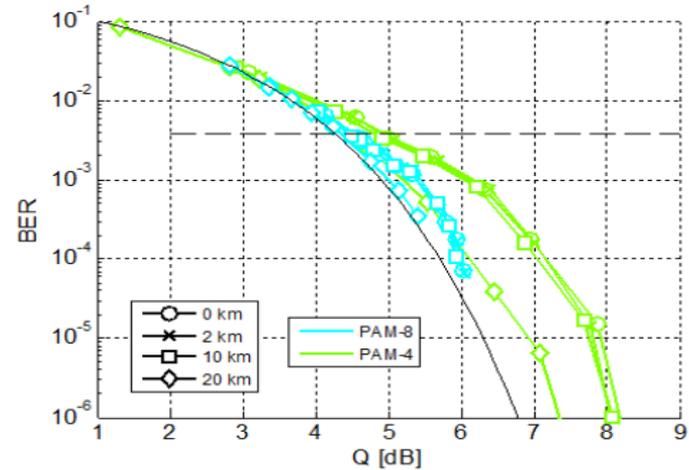

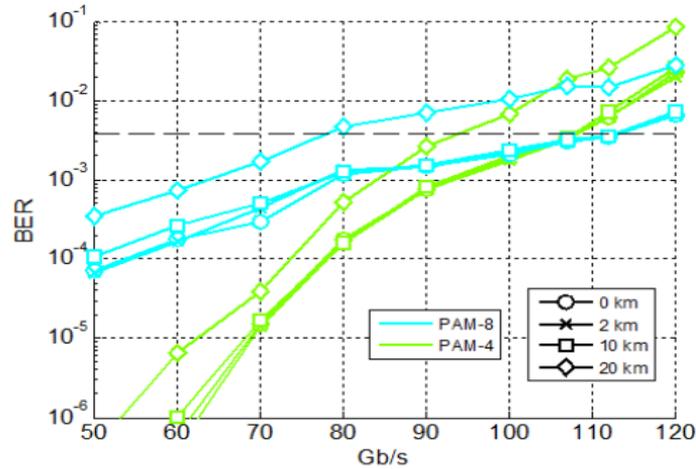

Note: BER measured and SNR calculated.

SNR (dB) calculated as:

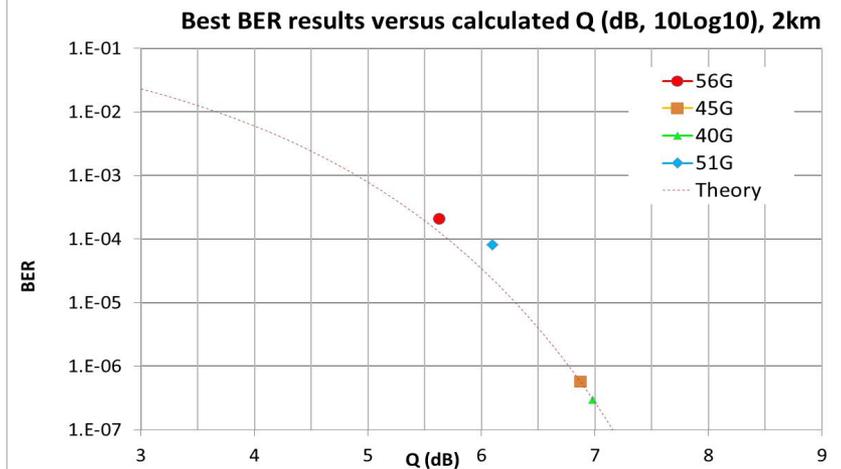

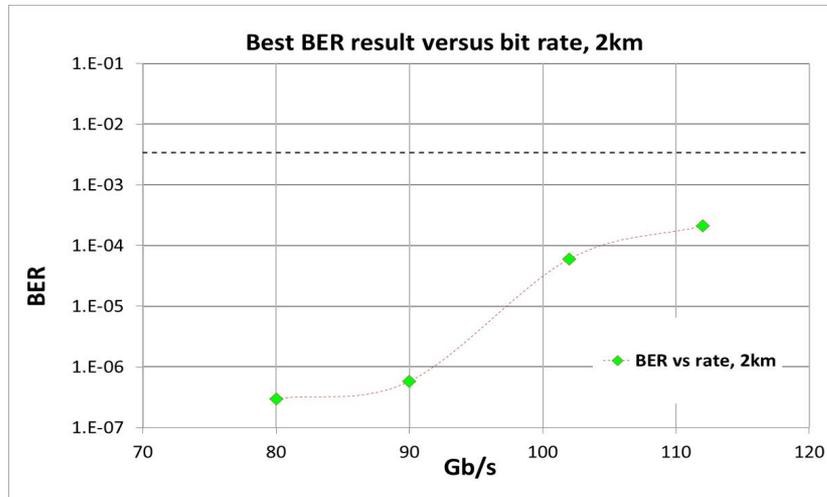

EyeOpens = MeanLevel(2:end)-MeanLevel(1:end-1);  
 EyeNoise = StdLevel(1:end-1)+StdLevel(2:end);  
 EyeSNR = 20\*log10(EyeOpens./EyeNoise);

# Comparison with bhatt\_3bs\_01a\_0714

bhatt\_3bs\_01a\_0714

mazzini\_3bs\_01a\_0714

# Summary

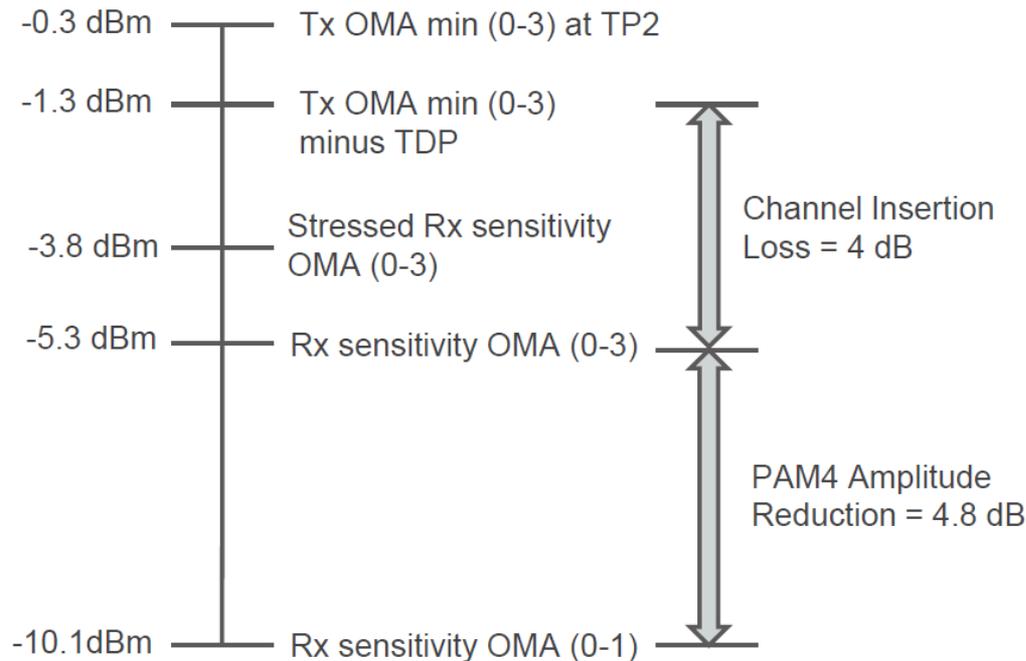

---

- Verified technical feasibility of 56Gbaud PAM-4 as a potential 4 Lane 400Gb/s solution
- Optical Link model validation (2km Duplex SMF) results are in line with previous works.
- Measured optical sensitivity in the ball park as required by several link budget analysis
- Discrete lab setup is certainly non-optimum
  - Expect better results with improved PAM-4 electrical generator and improved ADC (ENOB > 5 bits)
- Work ongoing. Will bring in further results as become available.

---

**Thank You**

# Link model (proposed in bhatt\_3bs\_01a\_0714)

## Penalties:

About 2.5 dB (1.5 dB residual ISI after equalization, 1 dB other penalties)

## Assumptions:

WDM mux + demux loss: 4.6 dB, included in TP2, TP3 specs.  
Effective TIA NEP: 21 pA/sqrt(Hz)  
Tx bandwidth: 28 GHz  
Rx bandwidth: 28 GHz

## Methodology:

Use equalization in Rx to reduce ISI penalty.  
Make up for PAM4 amplitude reduction with KP4 FEC.  
Pre-FEC:  $Q \sim 4$ ,  $BER \sim 1e-5$   
Post-FEC:  $Q > 7.34$ ,  $BER < 1e-13$   
Plan for margin
