1.4.313a pairset: Either of the two valid 4-conductor connections, Alternative A or Alternative B, as listed in IEEE 802.3, 145.2.4. The PSE Alternative A and Alternative B connections are referred to as Mode A and Mode B, respectively, at the PD appears to be an ambiguous statement. Is this eight (8) or four (4) wires?

SuggestedRemedy

"1.4.313a pairset: valid 4-conductor connections, Alternative A or Alternative B, as listed in IEEE 802.3, 145.2.4. ... "

Response *Response Status* **C**

REJECT.

The definition clearly refers to a 4-wire connection.

Yseboodt, Lennart — Philips Lighting

Comment Type **ER** *Comment Status* **A** *Editorial*

We pulled in the definition of PSE as modified by 802.3bu.
The term "DTE powering" is still used here, which we now refer to as Power over Ethernet.
To be consistent, we call it "Power over Data Lines" for Clause 104.
There also seems to be a repeat of a sentence in the definition.
Given the extensive changes, we should just replace the definition completely.

SuggestedRemedy

1. Change the editing instruction from "Change 1.4.338 (as modified by IEEE Std 802.3bu-2016) as follows:"
to "Replace 1.4.338 (incorporating the changes made by IEEE Std 802.3bu-2016) as follows:"

2. New text:
"1.4.338 Power Sourcing Equipment (PSE): A DTE or midspan device that provides the power to a single link section. PSEs are defined for use with two different types of balanced twisted-pair PHYs. When used with 2 or 4 pair balanced twisted-pair (BASE-T) PHYs, see IEEE Std 802.3, Clause 33 and Clause 145, Power over Ethernet is intended to provide a single 10BASE-T, 100BASE-TX, 1000BASE-T, 2.5GBASE-T, 5GBASE-T, or 10GBASE-T device with a unified interface for both the data it requires and the power to process these data. When used with single balanced twisted-pair (BASE-T1) PHYs (see IEEE Std 802.3, Clause 104), Power over Data Lines is intended to provide a single 100BASE-T1 or 1000BASE-T1 device with a unified interface for both the data it requires and the power to process these data. A PSE used with balanced single twisted-pair PHYs is also referred to as a PoDL PSE."

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Anslow, Peter — Ciena Corporation

Comment Type **ER** *Comment Status* **A** *Editorial*

Comment i-2 was accepted in principle, but the change to the base text of 1.4.338 has not been done correctly.
When an amendment changes text that has already been changed by a prior amendment, the base text for the second amendment is the text as amended by the first amendment. This text is therefore shown without underline or strikethrough font. The only text in underline or strikethrough font is for changes being made by this amendment, not for changes already made by IEEE Std 802.3bu-2016.

SuggestedRemedy

Replace the current text of 1.4.338 with:
A DTE or midspan device that provides the power to a single link section. PSEs are defined for use with two different types of balanced twisted-pair PHYs. When used with 2 or 4 pair balanced twisted-pair (BASE-T) PHYs, (see IEEE Std 802.3, Clause 33<u> or Clause 145</u>), DTE powering is intended to provide a single 10BASE-T, 100BASE-TX, <s> or </s>1000BASE-T<u>, 2.5GBASE-T, 5GBASE-T, or 10GBASE-T</u> device with a unified interface for both the data it requires and the power to process these data. When used with single balanced twisted-pair (BASE-T1) PHYs (see IEEE Std 802.3, Clause 104), DTE powering is intended to provide a single 100BASE-T1 or 1000BASE-T1 device with a unified interface for both the data it requires and the power to process these data. A PSE used with balanced single twisted-pair PHYs is also referred to as a PoDL PSE.
<u>A DTE Power over Ethernet (Clause 33 and Clause 145) device that provides the power to a single link section. Power over Ethernet is intended to provide a single 10BASE-T, 100BASE-TX, 1000BASE-T, 2.5GBASE-T, 5GBASE-T, or 10GBASE-T device with a unified interface for both the data it requires and the power to process these data.</u>
Where <u> and </u> denote the start and end of underline font and <s> and </s> denote the start and end of strikethrough font.

The sentence structure does not quite work with the "and". As written each clause requires a verb.
A PD that requests Class 4 during Physical Layer classification, supports Multiple-Event Classification and Data Link Layer classification (see IEEE 802.3, Clause 33).

SuggestedRemedy

Add "supports" before "Data Link Layer"

Response *Response Status* **C**

REJECT.

Comment should address line 17. The change requested is already in the definition.

Cl **1** *SC* **1.4.417** *P* **25** *L* **17** # r01-54

Agnes, Andrea — STMicroelectronics

Comment Type **G** *Comment Status* **A** *Definitions*

The definition:
1.4.417 Type 2 PD: A PD that provides a Class 4 signature during Physical Layer classification, understands 2-Event classification, and is capable of Data Link Layer classification requests Class 4 during Physical Layer classification, supports Multiple-Event Classification, and supports Data Link Layer
classification (see IEEE 802.3, Clause 33).

uses a Multiple-Event Classification, but it is not defined in Clause 33.

SuggestedRemedy

Use the 2-Event Classification in the defintion as called in Clause 33. Then the definition became:

1.4.417 Type 2 PD: A PD that provides a Class 4 signature during Physical Layer classification, understands 2-Event classification, and is capable of Data Link Layer classification requests Class 4 during Physical Layer classification, supports 2-Event Classification, and supports Data Link Layer
classification (see IEEE 802.3, Clause 33).

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change "Mulitple-Event" to "2-Event"

Comment Type **TR** *Comment Status* **A** *PMD*

"A 100BASE-TX transmitter in a Type 2, Type 3, or Type 4 Endpoint PSE or Type 2, Type 3, or Type 4 PD delivering or accepting more than 13.0 W average power shall meet either the Open Circuit Inductance (OCL) requirement in 9.1.7 of TP- PMD, or meet the requirements of 25.4.5.1."

The reference to 13.0 W is incorrect as the equivalent number on the PSE side is 15.4W.
We really should be referring to Class here. But... do we mean assigned Class ? It would be strange that a data requirement depends on the assigned Class.
It seems this whole construction with "more than 13.0 W" was introduced not to add a requirement to Type 1.
Let's simplify.

SuggestedRemedy

- Change quoted sentence to read:
"A 100BASE-TX transmitter in a Type 2 Endpoint PSE or Type 2 PD delivering or accepting more than 13 W average power shall meet either the Open Circuit Inductance (OCL) requirement in 9.1.7 of TP- PMD, or meet the requirements of 25.4.5.1."

- Add new sentence:
"A 100BASE-TX transmitter in a Type 3 or Type 4 Endpoint PSE or Type 3 or Type 4 PD shall meet either the Open Circuit Inductance (OCL) requirement in 9.1.7 of TP- PMD, or meet the requirements of 25.4.5.1."

aLldpXdot3LocPowerClassExt
- The enumerated values only list PSE and PD... when they should list the possible Classes.
- The descriptive text is incomplete.

SuggestedRemedy

- Replace the ENUMERATED VALUEs by:
 * dualsig :: Dual-signature PD
 * class8 :: Class 8
 * class7 :: Class 7
 * class6 :: Class 6
 * class5 :: Class 5
 * class4 :: Class 4
 * class3 :: Class 3
 * class2 :: Class 2
 * class1 :: Class 1

- Replace the "BEHAVIOUR DEFINED AS:" by:
"For a single-signature PD, a read-only value that indicates the requested Class during Physical Layer Classification (see 145.3.6). For a dual-signature PD, a read-only value set to 'dualsig'.
For a PSE connected to a single-signature PD, a read-only value that indicates the currently assigned Class (see 145.2.7). For a PSE connected to a dual-signature PD, a read-only value set to 'dualsig'."

- Change the "BEHAVIOUR DEFINED AS:" for aLldpXdot3LocDualSigPowerClassExtModeA and aLldpXdot3LocDualSigPowerClassExtModeB to follow the style above.

Cl **33** *SC* **33.4.9.2.1** *P* **71** *L* **42** # r01-14

Anslow, Peter — Ciena Corporation

Comment Type **ER** *Comment Status* **A** *Editorial*

The editing instructions and subclause numbering for 33.4.9.2.1 up to 33.4.9.3.2 are garbled (e.g. a change instruction for a new subclause, etc.).
The base document has:
33.4.9.1.3 Return loss
33.4.9.1.4 Work area or equipment cable Midspan PSE
33.4.9.2 Midspan signal path requirements
33.4.9.2.1 Alternative A Midspan PSE signal path transfer function

Attempting to understand the intent of the draft, it appears to be to create:
33.4.9.1.3 Return loss [changed subclause]
33.4.9.2 Cord Midspan PSE [changed subclause re-numbered from 33.4.9.1.4]
33.4.9.2.1 Maximum link delay [new subclause]
33.4.9.2.2 Maximum link delay skew [new subclause]
33.4.9.3 Coupling parameters between link segments [new subclause]
33.4.9.3.1 Multiple disturber power sum alien near-end crosstalk (PSANEXT) loss [new subclause]
33.4.9.3.2 Multiple disturber power sum alien far-end crosstalk (PSAFEXT) loss [new subclause]
33.4.9.4 Midspan signal path requirements [re-numbered subclause]
33.4.9.4.1 Alternative A Midspan PSE signal path transfer function [re-numbered subclause]

Assuming that this is correct, then a scheme in line with usual 802.3 re-numbering rules would be:
33.4.9.1.3 Return loss [changed subclause]
33.4.9.1a Cord Midspan PSE [changed subclause re-numbered from 33.4.9.1.4]
33.4.9.1a.1 Maximum link delay [new subclause]
33.4.9.1a.2 Maximum link delay skew [new subclause]
33.4.9.1b Coupling parameters between link segments [new subclause]
33.4.9.1b.1 Multiple disturber power sum alien near-end crosstalk (PSANEXT) loss [new subclause]
33.4.9.1b.2 Multiple disturber power sum alien far-end crosstalk (PSAFEXT) loss [new subclause]
33.4.9.2 Midspan signal path requirements [unaltered subclause]
33.4.9.2.1 Alternative A Midspan PSE signal path transfer function [unaltered subclause]

SuggestedRemedy

On page 71, line 21, change the editing instruction to:
"Change the title and text of 33.4.9.1.4 and re-number it to 33.4.9.1a as follows:"
On page 71, line 42, change the editing instruction to:
"Insert 33.4.9.1a.1, 33.4.9.1a.2, and 33.4.9.1b (including its subclauses) as follows:"
On page 72, line 18, remove the "change" editing instruction.
Re-number the headings to:
33.4.9.1a Cord Midspan PSE
33.4.9.1a.1 Maximum link delay
33.4.9.1a.2 Maximum link delay skew
33.4.9.1b Coupling parameters between link segments
33.4.9.1b.1 Multiple disturber power sum alien near-end crosstalk (PSANEXT) loss
33.4.9.1b.2 Multiple disturber power sum alien far-end crosstalk (PSAFEXT) loss

Yseboodt, Lennart — Philips Lighting

Comment Type **TR** *Comment Status* **A** *DLL*

In 802.3-2015, in Clause 79, the permitted value range for the PD requested power and PSE allocated power value fields ranged 1 to 255.
By mistake, in Clause 33 the permitted range started at zero.
The value of zero is undefined in DLL.

In 802.3bt we are changing Clause 79 to permit value zero, this is required to support dual-signature power negotiation.
However that, in combination with the current value ranges in 33.6.3.3 makes zero a legal value for legacy devices.
Since this is undefined, we must prevent this.
The proposed solution is to restrict the value range in 33.6.3.3.
In summary, we are moving a restriction from Clause 79 to 33.6.3.3, the net result is an identical permitted value range for legacy devices.

A supporting MR has been filed for this comment.

SuggestedRemedy

In subclause 33.6.3.3 (variables, DLL classification), change the "Values:0 through 255" to "Values 1 through 255" for the following:
- MirroredPDRequestedPowerValue
- MirroredPSEAllocatedPowerValue
- PDRequestedPowerValueEcho
- PDRequestedPowerValue (here change to "0 through PD_DLLMAX_VALUE")
- PSEAllocatedPowerValue
- PSEAllocatedPowerValueEcho

Comment Type **E** *Comment Status* **A** *Editorial*

The base version of 79.3.2.5 has "(see 33.3.7.2)" and 33.3.7.2 is "Input average power".
The draft has: "(see <u>33.3.8.2 and 145.3.8.2</u>)" where <u> and </u> are the start and end of underline font.
"33.3.7.2" has disappeared and 33.3.8.2 in underline font has replaced it, but 33.3.8.2 does not exist.

SuggestedRemedy

Change "33.3.8.2" to "33.3.7.2" without the underline font.

Skinner, John

Comment Type **E** *Comment Status* **A**

Clause heading text for 79.3.2.6d.2 is "PD 4PID". This does not agree with the field name in Table 79-6d-System setup field, "PD Load". This appears to be an editorial issue where the clause was actually intended to add a description of the new use for bit 2 in Table 79-4-Power type/source/priority field.

SuggestedRemedy

The clause should be renumbered 79.3.2.4.2 "PD 4PID", and should be located after line 44 on page 83.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

- Delete subclause 79.3.2.6d.2
- Add new subclause under 79.3.2.4 title "PD 4PID" with content:

This field shall be set according to Table 79-4 when the power type is PD to indicate whether the PD support powering of both Modes simultaneously.
This field shall be set to '0' when the power type is PSE.

This resolution is identical to comment #116.

Cl **79** *SC* **79.3.2.6d.2** *P* **87** *L* **50** # r01-116

Yseboodt, Lennart Philips Lighting

Comment Type **TR** *Comment Status* **A** *LLDP*

We have moved the PD 4PID bit from the System setup field to Power type/source/priority field, but failed to move the descriptive subclause with it.
Also the text in that subclause needs to be updated.

Note that we no longer need a 'shall' for Type 3/4 PDs, because that is now handled by the DLL power control state diagrams.

SuggestedRemedy

- Delete subclause 79.3.2.6d.2
- Add new subclause under 79.3.2.4 title "PD 4PID" with content:

This field shall be set according to Table 79-4 when the power type is PD to indicate wether the PD support powering of both Modes simultaneously.
This field shall be set to '0' when the power type is PSE.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

- Delete subclause 79.3.2.6d.2
- Add new subclause under 79.3.2.4 title "PD 4PID" with content:

This field shall be set according to Table 79-4 when the power type is PD to indicate whether the PD support powering of both Modes simultaneously.
This field shall be set to '0' when the power type is PSE.

Yseboodt, Lennart Philips Lighting

Comment Type **T** *Comment Status* **A** *LLDP*

In Table 79-6d the Power Type ext field describes the Type of the PSE or PD.
This still includes entries for Type 1 / Type 2, which no longer makes sense given that they are barred from sending the T3/4 extension fields.

SuggestedRemedy

- Reduce field to 3 bits with following content:
111 Reserved / Ignore
110 Type 4 dual-signature PD
101 Type 4 single-signature PD
011 Type 3 dual-signature PD
010 Type 3 single-signature PD
001 Type 4 PSE
000 Type 3 PSE

- Move the reserved bit on bit position 1 to the top (which now has bits 7:4 as Reserved)

- Update Clause 30 enumeration to match

Response *Response Status* **C**

Darshan, Yair

Comment Type **T** *Comment Status* **A** *LLDP*

This comment is marked PDISO-1.
In the text for 79.3.2.6d.3 PD Load: "This field shall be set according to Table 79-6d when the power type is PD. Electrically isolated for this bit
field shall mean greater than or equal to 50 k ohm resistance between any one connection of Mode A and any one connection on Mode B, when measured using at least VPort_PSE-2P minimum for Type 4 PSEs. This field shall be set to 0 when the power type is PSE." we have few issues:
1) The part ".....between any one connection of Mode A and any one connection on Mode B..." is not clear and may lead to overdesign. The current isolation requirement of 50 Kohm is for the load during power up and power on states and not during detection and classification states.
2) The isolation during detection of dual-signature PD need to be higher than 50K (at least 500K) and is required between the negative connections of Mode A and Mode B. Regarding the positive pairs, this requirement is optional.
3) These requirements are for Type 3 and 4 PSEs and not just for Type 4 PSE.

SuggestedRemedy

Change from "This field shall be set according to Table 79-6d when the power type is PD. Electrically isolated for this bit field shall mean greater than or equal to 50 k ohm resistance between any one connection of Mode A and any one connection on Mode B, when measured using at least VPort_PSE-2P minimum for Type 4 PSEs. This field shall be set to 0 when the power type is PSE."
To:
"This field shall be set according to Table 79-6d when the power type is PD. Electrically isolated for this bit field shall mean greater than or equal to 50 k ohm resistance between any one connection of Mode A and any one connection on Mode B in the powerup and power on states and 500K between the negative pairs of Mode B during connection check, detection and classification states, when measured using at least VPort_PSE-2P minimum for Type 3 and Type 4 PSEs. This field shall be set to 0 when the power type is PSE."

Comment Type **E** *Comment Status* **R** *Editorial*

LATE COMMENT: Improve clarity of sentence.

SuggestedRemedy

Change text: 'The interface between each of the elements is called the Power Interface (PI).' to: 'The interface between each of the power elements is called the Power Interface (PI).'

Response *Response Status* **C**

REJECT.

The suggested remedy only adds ambiguity. "The interface between each of the power elements" makes it sound like an interface between the PSE and the PD since those are the two elements hat use the word "power" in their description (the cabling does not appear to be a "power element").

Cl **145** *SC* **145.1** *P* **103** *L* **17** # r01-494

Thompson, Geoffrey — Individual

Comment Type **E** *Comment Status* **A** *Editorial*

LATE COMMENT: Improve clarity of text.

SuggestedRemedy

Swap order of PD sentence and link section sentence.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change:
The cabling portion of the system is defined as the Link Section. The interface between each of the elements is called the Power Interface (PI). The PD is an element of the powered DTE. The link section shares use of the cabling with the link segment used for data transmission. The PSE is normally an element of the powering DTE but may, instead, be located within the cabling portion of the system.

To:
The cabling portion of the system is defined as the link section. The link section shares use of the cabling with the link segment used for data transmission. The PSE is normally an element of the powering DTE but may, instead, be located within the cabling portion of the system. The PD is an element of the powered DTE.

Comment Type **TR** *Comment Status* **A** *PSE Types*

I lost count of how many times we have changed Table 145-2, and it is STILL wrong and confusing.

Issues:
- 'Supports 4-pair power' has entry 'Optional' and 'Yes' ==> this overlaps.
- "Range of maximum Class supported" ==> requires a PhD in subtle standards language to understand
- Every single one of the values for "Range of maximum Class supported" is wrong per the changes to D3.0

SuggestedRemedy

Will use column,row coordinates for changes, the heading row counts as row 0.
Change:
(2,1) replace "Optional" by "No"
(3,0) replace "Range of maximum Class supported" by "Highest Class supported"
(3,1) replace "Class 3 to 4" by "1 to 4"
(3,2) replace "Class 5 to 6" by "1 to 6"
(3,3) replace "Class 8" by "7 to 8"

Straddle columns with identical content where appropriate.

Response *Response Status* **C**

Comment Type **T** *Comment Status* **D** *PSE SD*

It will help the reader if we add text in the intro to the state machine that the PSE state machine is based on the following concept:
The primary alternative is the OmasterO and powering secondary is pending if primary is valid, so if primary fails detection, we donOt power the secondary regardless if its signature is valid or not.
(As a result, if we want to power secondary if primary fails detection, we can flip by going to IDLE and set the other alternative as primary.)

SuggestedRemedy

Add the following text after line 49:
"When PSE supports dual-signature PD, powering secondary is enabled if primary is valid regardless if secondary is valid. If powering secondary is needed when primary is not valid during 4-pair operation, it may be necessary to swap the roles pf Alternative A and Alternative B in IDLE in order to power the secondary."

Comment Type **TR** *Comment Status* **A** *Pres: Yseboodt6*

Our state diagrams are inordinately complex, with a very large number of variables (current count 163 for the PSE).
Given that our state diagrams mutated out of the Clause 33 state diagrams, we have low consistency in our variable descriptions.
Specifically, it is unclear what the rules are pertaining to each variable:
- may it be set externally ?
- only in IDLE, or at any time ?
- is it a state diagram internal variable ?
- is it a variable that must be set according to certain rules (eg. mps_valid) ?

The current descriptions don't help.
Some examples:
alt_done_pri: A variable used to coordinate... [this one is reserved for the state diagram]
alt_pri: A variable used to select... [this is a config variable]
alt_pwrd_pri: A variable that controls... [also reserved for the state diagram]
autoclass_enable: A control variable indicating... [configuration]
class_4PID_mult_events_pri: A variable indicating... [configuration]
det_once_sec: This variable indicates... [reserved for state diagram]
MirroredPDAutoclassRequest: A control variable output... [reserved for state diagram]
mps_valid: This variable indicates the presence or absence of a valid MPS... [mandatory set per requirements]

If we don't specify the 'usage rules' of variables, the state diagram can be made to do anything.

A bunch of descriptive text was added after CC_DET_SEQ:
"For a single-signature PD, parallel detection means that detection on both pairsets is done within the T det time period.
For a dual-signature PD, parallel detection means that detection on both pairsets is done within the same T det time period.
For a single-signature PD, staggered detection means that detection on both pairsets is done in different T det cycles.
For a dual-signature PD, parallel detection means that detection both pairsets is done in different T det cycles."

I feel this text adds more confusion / risk of contradiction than that it clarifies. Do we want to keep it ?

If yes, the following issues:
- last sentence seems to want to say 'staggered detection' rather than parallel detection.
- That means the definition for staggered detection is the same for single and dual is the same.
- Is there a difference between the first two sentences ? If yes... it feels like it should be reversed ?

Descriptive text like this does NOTHING technically.
If we're worried about 'parallel detection' being interpreted as the actual detection happining precisely at the same time, I would offer that a do_detection_xxx function is perfectly allowed to be called, and wait around doing nothing for a while, (eg. while the other function is doing it's thing), as long as it meets the Tdet timing.
In fact, as we discovered, the functions MUST be able to wait in order to correctly be able to use CC_DET_SEQ=2 where the two detection functions and the cxn function are called at the same time.

SuggestedRemedy

Option 1: remove quoted text.

Option 2: [my suggestion based on some guess work]

Comment Type **TR** *Comment Status* **A** *Altpwrd*

COMMENT: ALT_PWRD
The TRUE definition of alt_pwrd_pri and alt_pwrd_sec is:
"The PSE has detected, classified, and will power a PD on the Primary Alternative, is powering the Primary Alternative."
and
"The PSE has detected, classified, and will power a PD on the Secondary Alternative."

Other comments fix the editorial issues with these sentences.

We discussed this at the last meeting and I feel we did not end up with a good solution.

The definition of variables should be restricted to what the variable does or represents. These variables' "TRUE" description includes behaviour that (should have) happened in the past, as well as making a forward looking statement.

If we look at how these variables are actually used, the definition really is very simple:

FALSE = The PSE is not to apply power to the XYZ Alternative.
TRUE = The PSE is to apply power to the XYZ Alternative.

SuggestedRemedy

Replace quoted sentences by:
"FALSE: The circuitry that applies operating voltage to the Primary Alternative is disabled."
and
"TRUE: The circuitry that applies operating voltage to the Primary Alternative is enabled."

And the same for Secondary.

Response *Response Status* **C**

Comment Type **T** *Comment Status* **A** *Altpwrd*

The text of alt_pwrd_pri variable "TRUE: The PSE has detected, classified, and will power a PD on the Primary Alternative,
is powering the Primary Alternative.", looks it has a copy past error. The part "is powering the Primary Alternative" need to be deleted. It should be similar to what we have in alt_pwrd_sec variable.

SuggestedRemedy

Change from: "TRUE: The PSE has detected, classified, and will power a PD on the Primary Alternative, is powering the Primary Alternative."
To: "TRUE: The PSE has detected, classified, and will power a PD on the Primary Alternative."

"A variable indicating the state of the PD 4PID bit in the 'Power type/source/priority' field"

Response *Response Status* **C**

ACCEPT.

Cl **145** *SC* **145.2.5.4** *P* **119** *L* **40** # r01-148

Yseboodt, Lennart — Philips Lighting

Comment Type **TR** *Comment Status* **A** *PD SD*

"dll_4PID A variable indicating the state of the PD 4PID bit in the 'power type/source/priority field', as defined in Table 79-4."

The values are described as:
"0: 2-pair power negotiated.
1: 4-pair power negotiated."

Issues:
1. The value description does not match the definition in Clause 79.
2. This variable does not have a mapping to aLldpXdot3LocPD4PID / aLldpXdot3RemPD4PID
3. It isn't being set properly by the DLL state diagrams (for Type 3/4 this variable must be set to True)
4. The value is an integer, but is used as a boolean in the PSE state diagram.

SuggestedRemedy

Do the following:
- Change values for dll_4PID as follows:
"FALSE: PD does not support powering of both Modes simultaneously
TRUE: PD supports powering of both Modes simultaneously"

- Add the following mappings to the (new) DLL mapping Tables:
PSE aLldpXdot3RemPD4PID => dll_4PID
PD aLldpXdot3LocPD4PID <= dll_4PID # Note: this entry to occur both in single and dualsig mapping table

- Add to INITIALIZE in Figure 145-41: "dll_4PID <= TRUE"
- Add to INITIALIZE in Figure 145-45 and 145-46: "dll_4PID <= TRUE"

- Add dll_4PID to the variable lists of the PD DLL control state diagrams

The function do_class_probe doesnOt return a value for error code (we have it only if we go through the states in the procedure when available power >=4). We can fix it in two ways:
Option A: To add output for the function do_class_probe such as class_error OR
Option B (Preferred) : To add new variable class_error to the variable list and add it to the input to the IDLE state in page 135.

SuggestedRemedy

1. Add the variable class_error to the variable list:
class_error
A variable indicating if during do_class_probe function, invalid class result was detected.
Values:
FALSE: No invalid class result was detected.
TRUE: Invalid class result was detected.
2. Change the input condition to IDLE in page 130 from:
(pse_enable = enable) * (pse_reset + iclass_lim_det + error_condition)
To:
(pse_enable = enable) * (pse_reset + iclass_lim_det + error_condition+class_error)

The function do_class_probe_pri doesnOt return a value for error code (we have it only if we go through the states). We can fix it in two ways:
Option A: To add output for the function do_class_probe_pri such as class_error_pri OR
Option B (preferred) : To add new variable class_error_pri to the variable list and add it to the input to the IDLE_PRI state in page 141.
Repeat this solution for the secondary as well.

SuggestedRemedy

1. Add the variable class_error_pri to the variable list:
class_error_pri
A variable indicating if during do_class_probe_pri function, invalid class result was detected.
Values:
FALSE: No invalid class result was detected.
TRUE: Invalid class result was detected.
2. Change the input condition to IDLE in page 141 from:
sism * (pse_reset_pri + error_condition_pri + iclass_lim_det_pri)
To:
sism * (pse_reset_pri + error_condition_pri + iclass_lim_det_pri+class_error_pri)
3. repeat the above solution for the secondary.

Inconsistent information between option_class_probe variable in page 121 line 29 and do_class_probe function on page 130 line 3.
option_class_probe description indicates that PSE will issue exactly 3 class events to determine the PD requested class where do_class_probe description indicates that the PSE will issue a number of class events limited to CLASS_EV1_LCE to MARK_EV3.
For determine the PD requested power the PSE need to issue exactly 3 class events and not any number limited by 3.

SuggestedRemedy

Change page 130 line 3from:
"This functions discovers the PD requested Class by producing a number of class events. The class events produced are limited to CLASS_EV1_LCE to MARK_EV3. The tlce_timer in CLASS_EV1_LCE may be replaced with the tcle2_timer to allow abbreviated class timing duration. This function returns the following variables:"

Yseboodt, Lennart — Philips Lighting

Comment Type **TR** *Comment Status* **A** *PSE SD*

The requirements on 4PID and pd_4pair_cand are incompletely implemented in the state diagram.
For dual-signature the value is set, however for single-signature it is not.
While pd_4pair_cand is never referenced by the single-sig state diagram (it is implicit), we should set it correctly to match with the 4PID text in 145.2.6.7. The current state diagram forces pd_4pair_cand to be False when a single-sig is connected, which is wrong.

This comment assumes that another comment will make changes to the SISM state diagrams such that they no longer continuously execute the ENTRY_PRI state (which would effectively force pd_4pair_cand to be False in single-sig).

SuggestedRemedy

- add "pd_4pair_cand = False" to IDLE
- add the following to CLASSIFICATION
"IF (pse_alternative = both) THEN
pd_4pair_cand = True
END"

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

If we want to match the intent of the text, the if statement should be based on sig_type. The only way to get to CLASSIFICATION in the SS state diagram is to have a SS result, but that meaning is kind of hidden with your proposed remedy.

Make the following changes:
- add "pd_4pair_cand = False" to IDLE
- add the following to CLASSIFICATION
"IF (sig_type = single) THEN
pd_4pair_cand = True
END"

There is a cornercase bug in single-signature classification.
If:
- pse_alternative = a or b (so, 2-pair PSE)
- option_2ev = True (PSE only wants to do 2 class events when it has class 4 power)
- pse_allocated_pwr > 4 (a bit strange, but it is an allowed permutation...)

Then the branch logic out of CLASS_EV2 is wrong and it makes a third class event even though option_2ev is set.

Also, we should reset allocated power to zero in IDLE.

SuggestedRemedy

- Change logic from CLASS_EV2 to MARK_EV_LAST to:
"tcev_timer_done * option_2ev * ((pse_avail_pwr = 4) + (pse_alternative != both)) * (pd_class_sig = 4)"

- Change logic from CLASS_EV2 to MARK_EV2 to:
"tcev_timer_done * (pd_class_sig = 4) * (((pse_avail_pwr > 4) * (pse_alternative = both)) + !option_2ev)"

- Add to IDLE
"pse_allocated_pwr = 0"

This comment will be OBE to the comment marked GIL_1 if GIL_1 will be accepted.
In the exit from CLASS_EV3 to MARK_EV3 we have the following condition:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig 4) *
(pse_avail_pwr > 4) * ((pd_class_sig = 0) + (pse_avail_pwr > 5))

The part (pse_avail_pwr > 4) * ((pd_class_sig = 0) + (pse_avail_pwr > 5)) is logically identical to:
(pse_avail_pwr > 4)* (pd_class_sig = 0)+(pse_avail_pwr > 4)*(pse_avail_pwr > 5) which mean:
(X>4)*(X>5) which is X>5.

SuggestedRemedy

Change from:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig != 4) *
(pse_avail_pwr > 4) * ((pd_class_sig = 0) + (pse_avail_pwr > 5))
to:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig != 4) *
((pse_avail_pwr > 4) * (pd_class_sig = 0) + (pse_avail_pwr > 5))

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change from:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig != 4) *
(pse_avail_pwr > 4) * ((pd_class_sig = 0) + (pse_avail_pwr > 5))
to:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig != 4) *
(((pse_avail_pwr = 5) * (pd_class_sig = 0)) + (pse_avail_pwr > 5))

Also change CLASS_EV3->MARK_EV_LAST to be more obvious:
tcev_timer_done * ((pse_alternative != both) + (pd_class_sig = 4) + (((pse_avail_pwr = 5) * (pd_class_sig != 0)) + (pse_avail_pwr < 5)))

Darshan, Yair

Comment Type **T** *Comment Status* **R** *PSE SD*

This comment is marked GIL_1.
In the exit from CLASS_EV3 to MARK_EV3 we have the following condition:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig 4) *
(pse_avail_pwr > 4) * ((pd_class_sig = 0) + (pse_avail_pwr > 5))

The part (pse_avail_pwr > 4) * ((pd_class_sig = 0) + (pse_avail_pwr > 5)) is logically identical to:
(pse_avail_pwr > 4)* (pd_class_sig = 0)+(pse_avail_pwr > 4)*(pse_avail_pwr > 5)
Few issues:
1) The part: (pse_avail_pwr > 4)*(pse_avail_pwr > 5) has the same meaning as (pse_avail_pwr > 5) resulting with keeping only (pse_avail_pwr > 5)
Now we have left with
((pse_avail_pwr > 4)* (pd_class_sig = 0)+(pse_avail_pwr > 5)).
2) The part ((pse_avail_pwr > 4)* (pd_class_sig = 0)+(pse_avail_pwr > 5)) is equivalent to (pse_avail_pwr >= 5) because we already meets
(pd_class_sig 4) and (pse_avail_pwr >= 5) resulting with the need to generate the 4th class event

SuggestedRemedy

change from:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig 4) *
(pse_avail_pwr > 4) * ((pd_class_sig = 0) + (pse_avail_pwr > 5))
To:
tcev_timer_done * (pse_alternative = both) * (pd_class_sig 4) *
(pse_avail_pwr >= 5)

Response *Response Status* **C**

REJECT.

These are not equivalent. The current logic only allows the PSE to proceed to MARK_EV3 when pse_avil_pwr = 5 if pd_class_sig = 0. In other words, the if the PSE only has 45W available, it can only proceed to MARK_EV3 if the PD is asking for 45W (pd equivalent).

The sugested logic allows the PSE to move to MARK_EV3 whenever it has 45W available, no matter what the PD is requesting. This is a problem if the PD is requesting anything higher than class 5.

RAN, ADEE

Intel Corporation

Comment Type **T** *Comment Status* **A** *Editorial*

This diagram uses an empty pentagon to denote a transition from a state on another page, where the "to" arrows include the state name.

This notation does not have precedence in other state diagrams (according to a non-thorough search).

The corresponding state diagram in clause 33 uses letters inside pentagons for both "from" and "to" directions. This is the common convention in other clauses I know.

Introducing a new graphical convention without explanation is may be confusing for readers.

This also applies to the Single-signature PD state diagram in 145.3.3.7.

SuggestedRemedy

Revert to the common convention of including the same identifier in both "from" and "to" pentagons (using state names instead of single letters is okay).

Alternatively, add text in the "conventions" subclause to describe this new convention.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Append to 145.2.5.2 as follows:

"State diagrams may span over multiple pages. Arcs between states located on a different page within the same state diagram are drawn using a label containing the destination state's name at the originating state. An empty label is used at the destination state to indicate that there exists an entry, or entries, from another state."

The semi-independent PSE state diagrams' states all end on "_PRI" or "_SEC" to denote which SISM machine they are part of.
The states SEMI_PWRON_PRI and SEMI_PWRON_SEC are an exception to this, being part of the top level state diagram.

SuggestedRemedy

- Rename SEMI_PWRON_PRI to PRIMARY_SEMI_PWRON
- Rename SEMI_PWRON_SEC to SECONDARY_SEMI_PWRON

(don't forget the label on page 139!)

we need to set the sig_pri and sig_sec to FALSE in the top level state machine at IDLE state otherwise, we will have cross issues between two state machines parts.
Analysis:
When a single-signature is connected, ENTRY_PRI is processed continuously because "!sism" is TRUE which sets sig_pri to 'invalid' continuously, which breaks the main state diagram.
Same happen in the secondary.
To resolve it, we need to set the sig_pri and sig_sec to FALSE in the top state machine at idle state. This will also reset the signals for the single signature state machine, something that is not happening currently.

SuggestedRemedy

Add the following assignments to the IDLE state in page 135 line 7.:
sig_pri <==FALSE
sig_sec <== FALSE

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Add in state "IDLE" the following statements:
"stop tcc2det_timer"
"stop tdet2det_timer"
"sig_pri = invalid"
"sig_sec = invalid"

Comment Type **T** *Comment Status* **A** *Pres: Yseboodt3*

This comment is marked AVI_22.
In the ENTRY_PRI state, the variable "det_start_pri <== TRUE" is in the wrong place since we will be always in ENRY_PRI when !sism=TRUE which will set det_start_pri<==TURE even if we didn't do_detect_pri. We need to move it to the to state START_CXN_CHK_DETECT in page 135 line 47.
Other issue that ends with the same remedy for "det_start_sec <== TRUE" which is in wrong location in DETECT_EVAL_SEC state. The problem is that "det_start_sec <== TRUE" is set after do_detect_sec was done.

SuggestedRemedy

1. Move "det_start_pri <== TRUE" to state START_CXN_CHK_DETECT in page 135 line 47
2. Move "det_start_sec <== TRUE" to state START_CXN_CHK_DETECT in page 135 line 47

This comment is marked CLASS_PROB_PRI_2.
It is not clear why we used single option_class_probe for both primary and secondary with dual-signature and for single-signature. Few issues:
a) What if the available power will be <4 for the primary alternative and the available power >4 for the secondary?
b) the usage of option_class_probe for single-signature and dual-signature is not exactly the identical.
Therefore, the option_class_probe need to be separate for primary and secondary like in any other parameter in the spec for dual-signature that deals with class and power.

SuggestedRemedy

Adopt the propose remedy to the comment marked CLASS_PROB_PRI_1. [It resolves both comment marked CLASS_PROB_PRI_1 and comment is marked CLASS_PROB_PRI_2.]

This comment is marked CLASS_PROB_PRI_1.
Wrong and impossible logic of pse_avail_pwr_pri >= 4) in the exit from CLASS_PROBE_PRI to IDLE_PRI if the input to CLASS_PROBE_PRI is only allowed for pse_avail_pwr_pri < 4 per the current option_class_probe definition. The option_class_probe definition is good for single-signature PD but cannot be used in the dual-signature part of the PSE state machine per the current implementation of the CLASS_PROBE_PRI exit logics.

SuggestedRemedy

1. In the exit from CLASSIFICATION_PRI to CLASS_PROBE_PRI, replace option_class_probe with option_class_probe_pri.
2. Add new variable option_class_probe_pri to the variable list with the following definition:
"option_class_probe_pri
This variable indicates if the PSE should determine the PD requested Class on the Primary Alternative by issuing 3 class events. When set to TRUE, the PSE will issue 3 class events to determine the PD requested Class, perform a classification reset by applying VReset for at least TReset to the PI (see Table 145-14), followed by a normal classification procedure.
Values:
FALSE: The PSE will not probe for the PD requested Class.
TRUE: The PSE probes for the PD requested Class."
3. Repeat the solution for the secondary.

Peker, Arkadiy — Microsemi Corporation

Comment Type **TR** *Comment Status* **A** *Pres: Darshan3*

A problem was identified with the primary (and secondary) state machine that results with issuing 3 class events when the available power is 3 and powering up while the concept is to issue only one class event and powering up. The problem has been created at 4PID3_PRI state which doesn't allow going to CLASS_RESET_PRI in this scenario due to the questions if (temp_var_pri = 4) or not in the conditions at the exits of 4PID3_PRI.
Example: Let's assume the following conditions:
pse_avail_pwr_pri<4
Option_class_probe=FALSE
class_4PID_mult_event_pri=TRUE
pd_req_pwr_pri = class 3 (code 3,3,0).
Now we are in CLASS_EV3_PRI.

Now, the previous temp_var_pri=3, the current pd_class_sig_pri=0, resulting with moving to 4PID3_PRI due to (pd_class_sig_pri not equal temp_var_pri)* (pd_class_sig_pri = 0)=TRUE. As a result, moving to MARK_EV_LAST_PRI, CLASS_EVAL_PRI and then POWER_UP.
The end result is doing 3 class events and power up even if pse_avail_pwr_pri<4
While the concept requires doing 1 class event and power up.
The problem resulted from the 4PID3_PRI exit that doesn't allow to go CLASS_RESET_PRI due to redundant question if (pse_avail_pwr_pri < 4) * (temp_var_pri = 4) while what is important is only if (pse_avail_pwr_pri < 4).
If we remove the part (temp_var_pri = 4) and (temp_var_pri not equal 4) from both exits, this problem will be solved.
This is not the end of this problem. Now After fixing it and doing CLASS_RESET_PRI and going to CLASS_EV1_LCE_4PID_PRI, we will not power because the access to MARK_EV_LAST_PRI is blocked by the condition tlce_timer_pri_done * (pd_class_sig_pri = 4) while pd_class_sig_pri=3. The proposed fix for it is to delete the part (pd_class_sig_pri = 4) and to delete the exit from CLASS_EV1_LCE_4PID_PRI to IDLE_PRI.

SuggestedRemedy

1. Change the exit from 4PID3_PRI to CLASS_RESET_PRI from:
   (pse_avail_pwr_pri < 4) * (temp_var_pri = 4)
   To (pse_avail_pwr_pri < 4)
2. Change the exit from 4PID3_PRI to MARK_EV_LAST_PRI from:
   (pse_avail_pwr_pri >= 4) + (temp_var_pri not equal 4)
   To: (pse_avail_pwr_pri >= 4)
3. Change the exit from CLASS_EV1_LCE_4PID_PRI to to MARK_EV_LAST_PRI from:
   tlce_timer_pri_done * (pd_class_sig_pri = 4)
   To: tlce_timer_pri_done
4. Delete the exit from CLASS_EV1_LCE_4PID_PRI to IDLE_PRI

"In PSE dual-sig class diagrams, CLASS_EV1_LCE_4PID_X states check for ""pd_class_sig_x = 4"" as a double-check that PD class_ev1 response has not changed between class reset events. Now that class_probe dumps into this state, pd_class_sig_x could have been any valid class_sig (not just 4).
To fix:
1) ensure that pd_class_sig_x from class_ev1 is recorded to temp_var_x in all cases, and,
2) compare temp_var_x to pd_class_sig_x when exiting state CLASS_EV1_LCE_4PID_X."

This comment marked as AVI5.
In CC_DET_SEQ=3 and CC_DET_SEQ=2 the state machine can allow the secondary pair to power up (pri signature was valid) but primary fails in classification.
(Details: If sig_pri=valid and primary fails classification, it goes to IDLE_PRI. There is nothing in IDLE_PRI that resets sig_pri to invalid. Now secondary has valid detection and classification and powerup. If our intention is to not allow powering the secondary if primary fails to power up, then we need to add sig_pri=invalid to IDLE_PRI state.
Adding sig_pri<==invalid and sig_sec<==invalid in the IDLE_PRI and IDLE_SEC will resolve this issue. In addition, the lack of resetting sig_pri and sig_sec cause additional issues in simulations that are covered in other comments. See simulation results if needed in darshan_06_1117.pdf.

SuggestedRemedy

1. Add sig_pri<==invalid in the IDLE_PRI.
2. Add sig_sec<==invalid in the IDLE_SEC.

*** Comment submitted with the file 94875900003-stewart_04_1117.pdf attached ***

A few issues exist. The usage of pd_req_pwr_pri in CLASS_EVAL_PRI is dated and does not account for the updated usage of pse_allocated_pwr_xxx. The main PSE state diagram correctly references pse_allocated_pwr to decide if enough power exists to turn on PD. The pd_req_pwr_xxx variable is intended to communicate how much the PD requested, to the limit of the PSEs ability to know that information.
The state machine CLASS_EVAL_PRI/SEC exit arcs need to reference the correct variable.
The description of pd_req_pwr_pri/sec need to be updated to correctly describe the usage.
The Class 0 encoding needs to be removed from the do_class_probe_pri/sec return variable enumeration since it is not a legal return value (see do_classification_pri/sec.)

SuggestedRemedy

See stewart_04_1117.pdf

This comment marked as AVI6.
Similar setup as in AVI5, we get also the following issue:
in CC_DET_SEQ=2 the secondary pair will do 2 loops of detection classification before going to wait state. This problem was not exist in D3.0 and no we have it due to the changes made by http://www.ieee802.org/3/bt/public/sep17/stewart_02_0917_final.pdf on page 5 when we remove (CC_DET_SEQ=3) and (CC_DET_SEQ NE 3) from the exits of IDLE_SEC. Now the assignment det_once_sec=TRUE is not exists if we came from ENTRY_SEC to DETECT_EVAL_SEC as a result we have now the above issue. See simulation results if needed in darshan_06_1117.pdf.

SuggestedRemedy

Add to DETECT_EVAL_SEC the condition det_one_sec=TRUE.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

TOPIC:SIGNATURE
These comments fix inconsistencies in the word 'signature'.
When referring to detection, we should talk about "PD detection signature".
When referring to signature configuration, we should either say "single-signature PD, dual-signature PD, or PD signature configuration".
The draft contains 12 instances of the ambiguous "PD signature".

"The PSE is not required to continuously probe to detect a PD signature.
The period of time when a PSE is not attempting to detect a PD signature is implementation dependent.

A PSE detecting an invalid PD signature on either Alternative may perform detection on the other Alternative, and if valid may perform classification on that pairset."

SuggestedRemedy

Change as follows:
"The PSE is not required to continuously probe to detect a PD **detection** signature.
The period of time when a PSE is not attempting to detect a PD **detection** signature is implementation dependent.

A PSE detecting an invalid PD **detection** signature on either Alternative may perform detection on the other Alternative, and if valid may perform classification on that pairset."

Yseboodt, Lennart — Philips Lighting

Comment Type **T** *Comment Status* **R** *Connection Check*

"PSEs that will source power on both pairsets shall complete a connection check prior to the classification of a PD as defined in 145.2.7 to determine if the PSE is connected to a single-signature PD configuration, a dual-signature PD configuration, or neither."

While I certainly agree with this requirement, ... how are we going to test this ?
Can we somehow derive the result of cc-check at the PI ?

SuggestedRemedy

Rewrite this requirement such that it can be tested or remove it.
[I know this is not remedy, but I don't have a solution offhand on how to do this].

Response *Response Status* **C**

REJECT.

The comment did not provide a sufficient remedy and the comment resolution group could not come to consensus on an appropriate remedy.

Cl **145** *SC* **145** *P* **151** *L* **10** # r01-30

Anslow, Peter — Ciena Corporation

Comment Type **TR** *Comment Status* **R** *Editorial*

The response to unsatisfied comment i-1 against D3.0 was:
"We will work with editorial staff to try to clarify the style guide. Here is our opinion:
There is a distinction between an em-dash, which indicates 'a lack of data', and leaving a cell blank. Eg. For parameters that convey a range, having a blank 'Min' cell, does NOT indicate there is lack of data, rather that the minimum value is open-ended. An em-dash would convey an incorrect message. Em-dashes have been put in all cells where it is appropriate."
This interpretation of the style manual is different from the interpretation that has been used in recent amendments to IEEE Std 802.3. There is nothing different about Clause 145 that means that max or min cells without a value should be shown differently to those in other recent amendments.

SuggestedRemedy

Make sure all tables have an entry of em-dash or pointer to the requirement in currently blank min or max columns in accordance with all other recent amendments to IEEE 802.3. In particular, Tables 145-7, 145-8, 145-9, 145-10, 145-14, 145-16, 145-21, 145-28, 145-29, 145-32, 145-33.

Response *Response Status* **U**

REJECT.

The comment resolution group believes that the em-dash is technically inaccurate for these entries as it means there is "a lack of data". In Clause 145 the empty cells are due to open-ended ranges, not a lack of data.

"The PSE shall reject a pairset within a link section as having an invalid signature, when the pairset exhibits any of the following characteristics as defined in Table 145-10:"

For comparison, this is the text for valid:
"A PSE shall accept as a valid PD signature a pairset with all of the characteristics specified in Table 145-9."

What is "a pairset within a link section"... ?
This strange construction also exists in Clause 33.
The PSE is not in the business of rejecting pairsets or link sections...
Let's try to mimick the 'valid' text which makes at least some sense.

SuggestedRemedy

Replace as follows:
"The PSE shall reject as an invalid detection signature, a pairset which exhibits any of the following characteristics as defined in Table 145-10:"

Response *Response Status* **C**

Yseboodt, Lennart — Philips Lighting

Comment Type **TR** *Comment Status* **A** *4PID*

"PSEs shall determine whether an attached PD is a candidate to receive power on both pairsets prior to applying operating voltage to both pairsets. This determination is referred to as 4PID. 4PID shall be determined as a logical function of the detection state of both pairsets, the result of connection check as described in 145.2.6.1, mutual identification, and the results of the Power via MDI TLV described in 79.3.2. It shall be stored in the variable pd_4pair_cand, defined in 145.2.5.4.

A PSE shall not apply 4-pair power unless the PSE has detected a valid detection signature on both pairsets and one or more of the following conditions are met:"

No less than four shalls.
First shall : untestable (the shall is to determine something).
Second shall: untestable because unclear (again a determination without specifics on what is pass/fail)
Third shall : contradicted by the state diagram (but we will fix that) AND untestable.
Fourth shall: Hurray! A valid shall statement.

Also, the text refers to "the results of the Power via MDI TLV described in 79.3.2" which no longer has influence on pd_4pair_cand.

Also, the state diagram only follows this text partly, as pd_4pair_cand is only set for dual-signature operation.
Another comment will make state diagram changes, I won't do it here to keep of that stuff together.

SuggestedRemedy

Replace by:
"PSEs determine whether an attached PD is a candidate to receive power on both pairsets prior to applying operating voltage to both pairsets. This determination is referred to as 4PID. 4PID is a logical function of the detection state of both pairsets, the result of connection check as described in 145.2.6.1, and mutual identification. The variable pd_4pair_cand, defined in 145.2.5.4, contains the result of this determination.

A PSE shall not apply 4-pair power unless the PSE has detected a valid detection signature on both pairsets and one or more of the following conditions are met:"

"Measurements should be averaged using any sliding window with a width of 1 s."

Rejected comment i-79 against D3.0 wanted to remove this sentence with the following rationale:
This sentence follows after the definition of PClass and PClass-2P.
That whole section is informative in nature.
- Why is this a should ?
- Measurements of what ? PClass is a capability.
- The actual power requirement of a PSE is encoded in ICon-2P.

We need to find the appropriate place to indicate that PSE output power capability is to be measured with a sliding window.

SuggestedRemedy

Output 'power' is encoded in ICon-2P, hence it makes sense to put a sentence there.

- Remove quoted sentence
- In 145.2.8.5, page 164, line 43, after:
"PSEs shall be able to source I Con-2P , the current the PSE supports on each powered pairset, as defined in Equation (145-8)."
append:
"ICon-2P should be measured using a sliding window with a width of 1 second."

Comment Type **T** *Comment Status* **D** *PSE Power*

Modified comment from i-204 in D3.0.
In the text "PSEs shall be able to source ICon-2P, the current the PSE supports on each powered pairset, as defined in Equation (145-8).".
The text says that Icon-2P is the current that the PSE must support on each pair set per Eq 145-8. This current cannot be calculated per Equation 145-8 since Iport-2P_other has no numerical definition or can be calculated per the data in the spec as we do for all our equations in the spec. One may ask why we need to calculate it? The answer is because it is a spec and we cannot leave spec parameter/equation that has no solution. Otherwise why to spec it if it not needed?

SuggestedRemedy

In the definition of Iport-2P_other in the where list of Equation 145-8 append the following text to the existing definition:
"Iport-2P_other can be found by the measurement of the current difference between two pairs of the same polarity when PSE is connected to the test verification model and its operating conditions as described in 145.2.8.5.1"

In the last cycle the values of IUnbalance-2P were increased without corresponding changes to RSource and RLoad.
This leads to the 'extra' unbalance margin being assigned to both the PSE and the PD.
PSEs and PDs that meet their respective unbalance requirements will now exceed IUnbalance-2P when hooked up together.

I suspect we need updates to RSource and RLoad.

Comment Type **T** *Comment Status* **A** *Pres: Darshan5*

Table 145-17 has values that are the same as the values for Icon-2P_unb in Table 145-16. This intention of adding Iunbalance and Table 145-17 was to clearly specify what is minimum value of the current that PSE has to source and what is to maximum value of the current during unbalance conditions that PSE and PD should not cross. For this purpose, it is sufficient to define that Iunbalance-2P=Icon-2P_unb+2mA. This will set clear boundary between min/max values of these two parameters and also result with simpler spec.

SuggestedRemedy

In Table 145-17 make the following changes:
1) In the 2nd row, in the assigned class column change from "5" to "5 to 8".
2) In the 2nd row, in the Value column change from "0.56" to "Iunbalance-2P=Icon-2P_unb+0.002".
3) Delete rows 4-6.

Zimmerman, George — Aquantia, ADI, Comm

Comment Type **TR** *Comment Status* **A** *Pres: Darshan1*

"The PSE PI connector (jack) when mated with a specified balanced cabling connector (plug) shall meet the requirements of 145.2.8.5.1." - this is nonsensical. There is actually only one other requirement listed in 145.2.8.5.1, and I believe the intent is that that requirement should be stated so that it applies when the PSE PI is mated to a connector.

SuggestedRemedy

delete page 166, lines 44-45 (the quoted sentence in the comment), and insert new sentence after the sentence ending on line 30 of page 167 (sentence begins on line 29 "A PSE shall not source..."), new sentence to read ""This unbalance current requirement applies at the PSE PI connector (jack) when mated with a specified balanced cabling connector (plug)."

See comment i-126 / D3.0. which proposed a change to the turn off text.
That remedy was changed in the room, but we failed to look at the sentence that follows.
Those two are now in contradiction:

"The specification for T Off in Table 145-16 shall apply to the discharge time from VPort_PSE-2P min to V Off of a pairset with a test resistor of 320 kOhm attached to that pairset. In addition, it is recommended that the pairset be discharged when voltage is not applied. T Off starts when V PSE drops 1 V below the steady-state value after the alt_pwrd_pri and alt_pwrd_sec variables are cleared (see Figure 145-13). T Off ends when V PSE <= V Off max."

SuggestedRemedy

Either:
a) Change first sentence to:
"The specification for TOff in Table 145-16 shall apply to the discharge time from operating voltage to VOff of a pairset with a test resistor of 320 kohm attached to that pairset."

or;
b) Remove the sentence "T Off starts when V PSE drops 1 V below the steady-state value after the alt_pwrd_pri and alt_pwrd_sec variables are cleared (see Figure 145-13)."

Change middle sentence as follows:
"In addition, it is recommended that the pairset be discharged when operating voltage is not applied."

Response *Response Status* **W**

ACCEPT IN PRINCIPLE.

Yseboodt, Lennart Philips Lighting

Comment Type **ER** *Comment Status* **A** *Editorial*

Subclause 145.2.10 "PSE power removal" contains just one sentence:
"Figure 145-17, Figure 145-18, and Figure 145-19 show the PSE monitor state diagrams. These state diagrams monitor for inrush current and the absence of the Maintain Power Signature (MPS)."

It is followed by 145.2.11 which describes MPS.

In the base standard, the MPS requirements were a subclause of PSE power removal and subdivided in to AC and DC MPS.
The current 145.2.10 as-is makes little sense.
145.2.11 (on MPS), does a poor job of introducing the topic.

SuggestedRemedy

- Delete 145.2.10
- Add as new first paragraph to 145.2.11:
"A PSE is required to remove power when a powered connected PD no longer draws a minimum amount of current.
This is referred to as the 'Maintain Power Signature'. The PSE state diagrams in Figure 145-17 and Figure 145-18 monitor for the absence of MPS."

Response *Response Status* **C**

RAN, ADEE Intel Corporation

Comment Type **G** *Comment Status* **A** *Editorial*

Subclauses 145.3.3.3 through 145.3.3.7 discuss single-signature PDs.

Subclauses 145.3.3.4 through 145.3.3.12 are the equivalent of the above for dual-signature PDs.

It would be friendlier for readers (who may be interested in only one kind of PDs) to separate these clauses hierarchically. It would also be consistent with the similar structure of 145.5.3.

SuggestedRemedy

Create a subclause hierarchy as follows:

145.3.3.3 Single-signature PD state diagrams
145.3.3.3.1 Constants
145.3.3.3.2 Variables
145.3.3.3.3 Timers
145.3.3.3.4 Functions
145.3.3.3.5 State diagram
145.3.3.4 Dual-signature PD state diagram
145.3.3.4.1 Constants
145.3.3.4.2 Variables
145.3.3.4.3 Timers
145.3.3.4.4 Functions
145.3.3.4.5 State diagram

Consider also moving the following text from 145.3.3:

"Single-signature PDs shall provide the behavior of the state diagram shown in Figure 145-26 and Figure 145-27" - to the new 145.3.3.3 (and change to "diagrams" per other comment)

"Dual-signature PDs (...)" (the whole second paragraph) to the new 145.3.3.4.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Create a subclause hierarchy as follows:

145.3.3.3 Single-signature PD state diagrams
145.3.3.3.1 Constants
145.3.3.3.2 Variables
145.3.3.3.3 Timers
145.3.3.3.4 Functions
145.3.3.3.5 State diagram
145.3.3.4 Dual-signature PD state diagram
145.3.3.4.1 Constants
145.3.3.4.2 Variables
145.3.3.4.3 Timers
145.3.3.4.4 Functions
145.3.3.4.5 State diagram

move the following text from 145.3.3:

"Single-signature PDs shall provide the behavior of the state diagram shown in Figure 145-26 and Figure 145-27" - to the new 145.3.3.3 (and change to "diagrams" per other comment)

"Dual-signature PDs (.)" (the whole second paragraph) to the new 145.3.3.4.

Darshan, Yair

Comment Type **T** *Comment Status* **A** *Pres: Yseboodt8*

The PD state machine for single signature (and dual signature) has few issues concerning NOPOWER state and going back to INRUSH and back to POWER_DELAY.
1) Violation of tpowerdelay_timer when going from POWER_DELAY to NOPOWER.
2) Possible overload condition due to the assignment of (pse_power_level <== 8).
3) Allowing incompliant behavior of PDs that doesnOt lock their class event counter and sensitive to 2nd inrush counted as additional class event (I understand the need for this but we need to allow it as optional behavior and not mandatory behavior for PDs. For example: If PD didnOt lost its data when going to Vpd < Voff_pd, it doesnOt need to set (pse_power_level <== 8) in NOPOWER spec so the correct assigned class will not be destroyed.
Details of issue 1:
When actual Tinrush_PD<25msec and transitioning from POWER_DELAY to NOPOWER state due to VPD<VOff_PD, sets nopower variable to TRUE.
nopower variable=TRUE will lead to bypassing tpowerdelay_timer (80msec) when returning back to POWERED through INRUSH and POWER_DELAY states which will lead to PD overloading the PSE which is still in INRUSH state. (The 25msec number is due to the fact that we are going through INRUSH state twice in the above scenario)
This scenario happens whenever Vpd is lowered below Voff_pd in POWER_DELAY or POWERED states, causing a transition to NOPOWER state, then raised above Von_pd (regardless of the time VPD was below Voff_pd).
In the case where Tinrush_PD = 0 to 25ms, then the PD state-machine will do the transition from INRUSH to POWER_DELAY to NOPOWER to INRUSH to POWER_DELAY to POWERED in 2xTirush_PD.
This is a violation of Tdelay, which is minimum 80ms and may overload PSE by PD during INRUSH.
Same issue in dual-signature PD state machine.
Details of issue 2:
In the NOPOWER state, the assignment "pse_power_level <==8" will cause PD to have pse_available_power=8 even if originally prior to getting to NOPOWER state is was lower than 8.
As long as VPD>VReset_th, PD remembers its data. In the arguments why we add it in the past, it was claimed that PD may think that we have additional class event when transitioning from NOPOWER to INRUSH again. This argument seems not correct since PD required by spec to lock itself to ignore additional counts after first time going through inrush. Any way, we have big hole here.
Regarding PDs that doesn't lock class event counting, they are not compliant. I understand that we want to support this case in the field as well so we need to make the use of pse_available_power=8 optional as function if we lost the data or not i.e. compliant PDs will not have to do it otherwise they may go to overload conditions while they behaves correctly.
In addition, we need to add text that explains that the NOPOWER state was meant to be use for abnormal use cases and not as the typical behaviour otherwise we by pass the mandory requirements of the spec.
Bottom line: We have tried to allow supporting non-compliant PDs or PDs that their behavior is not defined by making the state machine to support those PDs but on the way we create problems that compliant PDs doesnOt have and we force them to behave in noncompliant way by violating other spec requirements.
Below is proposal to support those PDs without creating problems to PDs that behaves correctly.

SuggestedRemedy

1. In the exit from POWER_DELAY to NOPOWER and in the exit from POWERED to NOPOWER, change the condition from VPD < VOff_PD to (VPD < VOff_PD)*go2nopower.
2. Add the new variable go2nopower:
go2nopower
Implementation specific variable that indicates if PD will go to NOPOWER in case VPD < VOff_PD during POWER_DELAY or POWERED.
Values
FALSE PD will not use NOPOWER in case VPD < VOff_PD during POWER_DELAY or POWERED
TRUE PD will use NOPOWER in case VPD < VOff_PD during POWER_DELAY or POWERED
3. Repeat only steps 1 for dual-signature PD in page 190 for the above states.
4. [This solution allow not using pse_power_level <==8 in case PD didn't lost its data or change its data during the transition to POWER_DELAY through NOPOWER)]
Append the following text to the definition of nopower variable:
"If pse_power_level data was not lost or changed in the event of transitioning to POWER_DELAY through NOPOWER, the assignment pse_power_level<==8 may not be implemented in NOPOWERO

Yseboodt, Lennart — Philips Lighting

Comment Type **TR** *Comment Status* **A** *Pres: Yseboodt8*

There is a possibility for intentional abuse of the NOPOWER state in the PD state diagram.
A PD can exit the INRUSH state at any time less than 50ms to POWER_DELAY.
If it does so while the PSE is still in inrush, and VPD is less than Voff_pd, the state diagram loops through NOPOWER and defeats classification.
It is PD undemotion essentially.

To close this hole we need to remove the arc from POWER_DELAY to NOPOWER.

SuggestedRemedy

- Remove the arc from POWER_DELAY to NOPOWER.
- Same fix in the dual-signature state diagram.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Cl **145** *SC* **145.3.3.7** *P* **184** *L* **30** # r01-314

Peker, Arkadiy — Microsemi Corporation

Comment Type **TR** *Comment Status* **A** *Pres: Yseboodt8*

PD state machine (and any other state machine) doesn't need to contain states to describe uncompliant behavior. We have infinite numbers of them.
-If PD PI voltage is drop due to overload or short circuit, this PD is not compliant since the PD is required to limit its power consumption to PClass_PD by design.
-If PSE PI voltage is drop for a duration longer than allowed by the transient spec, it is non-compliant PSE.
As a result, falling below VPD<VOff_PD while PD was powered is non-compliant behavior.
-This behavior should not be described in the PD state machine.
-Specifically, if this behavior cause violation of other requirements in the spec, it should be avoided or corrected.
-The need to cover in the PD state machine legacy PD behavior and newly designs of 802.3bt is understood but we should not force this behavior on compliant PDs and at least make it optional.
Having the NOPOWER state route creates new non-compliant behavior such
1) Violation of tpowerdelay_timer when going from POWER_DELAY to NOPOWER.
2) Possible overload condition due to the assignment of (pse_power_level <== 8)
(Compliant PDs doesn't have this problem.
It is suggested to delete the NOPOWER state or to make the inputs to it selectable by the implementer.

SuggestedRemedy

Option 1:
Delete NOPWER state from the PD state machine with all the inputs/outputs to it and from it, including the variables associated with it.
Option 2:
1. Delete the exit from POWER_DELAY to NOPOWER. [This will resolve the issue of bypassing the 80msec timer.]
2a. Delete the assignment pse_avail_pwr<==8 from the NOPOWER state OR
2b) add the following text to the variable pse_power_level definition: "When in NOPOWER state, the assignment to the value 8 is optional."
"
Option 3:
1. Make the two inputs to NOPWER optional and pending in implementation specific variable. Change the condition of these two inputs to (VPD<VOff_PD) *option_nopower.
2. Add the variable option_nopower to the variable list.
option_nopower
Implementation specific variable that indicates if PD will go to NOPOWER in case VPD < VOff_PD during POWER_DELAY or POWERED.
Values
FALSE PD will not use NOPOWER in case VPD < VOff_PD during POWER_DELAY or POWERED
TRUE PD will use NOPOWER in case VPD < VOff_PD during POWER_DELAY or POWERED.

After selecting one of the proposed solutions or any other solution, Repeat it for dual-

signature PD in page 190 and update variable list accordingly.

Comment i-133 against D3.0 only instructed to make changes to single-signature, but fix also applies to dual-sig.

Issue:
Short summary: There is no mention in our spec that a PD should implement hysteresis for V_Mark_th.
Without hysteresis it is possible to get spurious class/mark transitions due to the voltage
drop of around 0.5V caused by the class current.
It is compounded by the PD state diagram listing VMark_Th in the constants section,
implying the value cannot change while the state diagram is running.

SuggestedRemedy

- Move VMark_th, VOff_PD, VOn_PD, VReset_th from 145.3.3.8 (constants) to 145.3.3.9 (variables)
- Change VReset_PD to VReset_PD_max

Abramson, David — Texas Instruments Inc

Comment Type **TR** *Comment Status* **D** *PD Mark*

The group has expressed a desire to deprecate clause 33 in the future. I have found one case in which the clause 145 makes it harder/more expensive to build a compliant PD (without any real benefit) and thus I doubt users would move over the Type 3 and thus clause 33 would never be deprecated.

The case is that of Type 1 PDs. Clause 145 currently requires all Type 3 PDs to include a mark signature, even class 1-3 PDs. This is a burden to the PD and we can elimate it easily.

I suggest that we only lower the minimum Mark Current for Class 1-3 Type 3 PDs which would allow the detect circuit already present in these PDs to be a compliant mark current.

SuggestedRemedy

Split item 3 of table 145-25 into two rows. The first row for class 1-3 with a minimum of 180uA. The second row for classes 4-8, with a minimum of 250uA.

Proposed Response *Response Status* **Z**

Abramson, David — Texas Instruments Inc

Comment Type **TR** *Comment Status* **D** *PD Mark*

"When the PD is presenting a mark event signature in a DO_MARK_EVENT state, as shown in the state diagram of Figure 145-26 and Figure 145-28, the PD shall draw IMark as defined in Table 145-25 and present a non-valid detection signature as defined in Table 145-22."

This would prevent class 1-3 PDs from being able to show their detect signature during the MARK state. Since these PDs are not required to count the class events, this requirement should not apply to them (the reason for the requirement is that PDs that count class pulses can count an extra pulse if they have a valid signature during mark and if plugged in during a detect cycle).

NOTE: I haven't considered DS PDs...

SuggestedRemedy

Make this requirement only apply to class 4-8 PDs.

"When the PD is presenting a mark event signature in a DO_MARK_EVENT state, as shown in the state diagram of Figure 145-26 and Figure 145-28, the PD shall draw IMark as defined in Table 145-25 and Class 4-8 PDs shall present a non-valid detection signature as defined in Table 145-22."

The newly inserted text about hysteresis is stated in weasel-words. "is required to" sounds like a normative statement.

If it is a normative requirement then it should include a "shall" and a definition of what hysteresis is appropriate (which would enable judging for compliance).

Also, there may be ways other than hysteresis to avoid erroneous transitions.

As it stands, this seems to be a recommendation (which makes sense), so it should be stated as a recommendation.

SuggestedRemedy

Change
"Appropriate hysteresis in the VMark_th threshold voltage is required to avoid erroneous transitions"

to
"Implementations should employ appropriate methods (such as hysteresis in VMark_th) to avoid erroneous transitions"

In the text "After power up, a PD that implements Autoclass shall draw its highest required power, PAutoclass_PD, subject
to the requirements on PClass_PD in 145.3.8.2, throughout the period bounded by....." we have the following issue:
According to the existing Autoclass text In 145.3.8.2 the text says that the limits of the autoclass power value is the assigned class. This may generate an overload condition according to the following example:
1) When we negotiate power through LLDP and we asked for 34W and received 34W. The assigned class will be 5 per table 145-12.
2) Now the PD requests Autoclass through LLDP and consumes 39W (it can consume more, up to the maximum of the assigned class=40W).
3) PSE will enter to overload condition/overpower and may shut the port off.
Possible solutions:
a) The fix for this is to limit autoclass power not according to the assigned class but to limit it to the PSE allocated power which is in the above example 34W and not 40W.
b) (Preferred, simpler) To keep it per the assigned class when layer 1 autoclass is used and limit the value of the autoclass power to the pse allocated power when autoclass is used through LLDP.

SuggestedRemedy

Change from:
"After power up, a PD that implements Autoclass shall draw its highest required power, PAutoclass_PD, subject to the requirements on PClass_PD in 145.3.8.2, throughout the period bounded by TAUTO_PD1 and TAU-TO_PD2, measured from when VPD rises above VPort_PD-2P min. The PD shall not draw more power than PAutoclass_PD at any point until VPD falls below VReset_PD max, unless the PD successfully negotiates a higher power level, up to the PD requested Class, through Data Link Layer classification as defined in 145.5."
To:
"After power up, a PD that implements Autoclass shall draw its highest required power, PAutoclass_PD, subject to the requirements on PClass_PD in 145.3.8.2, throughout the period bounded by TAUTO_PD1 and TAU-TO_PD2, measured from when VPD rises above VPort_PD-2P min.
When using Autoclass through LLDP, a PD that implements Autoclass shall draw its highest required power, PAutoclass_PD, up to PSEAllocatedPowerValue, throughout the period bounded by TAUTO_PD1 and TAU-TO_PD2, measured from the time MirroredPDAutoclassRequest is TRUE.
The PD shall not draw more power than PAutoclass_PD at any point until VPD falls below VReset_PD max, unless the PD successfully negotiates a higher power level, up to the PD requested Class, through Data Link Layer classification as defined in 145.5."

Yseboodt, Lennart Philips Lighting

Comment Type **TR** *Comment Status* **A** *PD Power*

Last cycle we removed the PD Type column in Table 145-29, and in the process we found 1 parameter that seemed to depend on Type: V_Overload-2P.
That is false, like other power related parameters, this also depends on assigned Class, not on Type.
Furthermore, the value for "Type 3" aka "Class 1-6" is wrong, it should be 39.4V

SuggestedRemedy

Replace rows:
- Single-signature PD, Class 1-6 and dual-signature PD Class 1-4 = 39.4V
- Single-signature PD, Class 7-8 and dual-signature PD Class 5 = 40.4V

Editor to split VOverload into a single-signature and dual-signature subitem in order to prevent large amount of text in the Parameter cell.

Johnson, Peter

Comment Type **T** *Comment Status* **A** *PD Power*

Draft 3.1 still has the issue where parameters entered as Maximums with no Minimums in Table 145-29 are sometimes treated as ranges and sometimes treated as constants. Example: Pport_PD (Items 8 and 9) are CLEARLY ranges, effectively from 0W to Pclass_PD. However Pclass_PD, Ppeak_PD, and their 2P equivalents are CLEARLY constants and are used as such in the text (e.g. 145.3.8.2, 145.3.8.3) and similarly in the PSE section (e.g. EQ 145-2). The PSE section does not have this problem as Pclass (and Pclass_2P) are defined in equations with maximum possible values in Table 145-11.

SuggestedRemedy

Expand Table 145-11 to include Pclass_PD, Pclass_PD-2P, Ppeak_PD, and Ppeak_PD-2P (adding 2 columns). It is not inappropriate to place these in the PSE section because there are equations in the PSE section that use all four parameters. Table 145-11 includes the column "Assigned Class" - so it has the correct index for these values. THEN... remove them from Table 145-29.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Add text to 145.3.8.2:

Pport_PD is the power drawn by a single-signature PD, defined in Equation 145-23a.

Pport_PD-2P is the power drawn by a given Mode of a dual-signature PD, defined in Equation 145-23b.

Pport_PD = VPD * Iport (145-23a)

Pport_PD-2P = VPD * Iport-2P (145-23b)

For single-signature PDs, the average value of Pport_PD shall not exceed Pclass_PD for the assigned class.

For a dual-signature PD, the average value of Pport_PD-2P shall not exceed Pclass_PD-2P for the assigned class.

Yseboodt, Lennart — Philips Lighting

Comment Type **TR** *Comment Status* **A** *Pres: Yseboodt8*

Table 145-29, item 18: VOff_PD is a range from 30V to VPort_PD-2P min.

This is in direct contradiction with the peak and transient specification, both of which are conditions that require the PD to continue operating, but both cause VPD to go into the VOff_PD range.
In addition, per the state diagram, drawing peak power would warrant a loop through the NOPOWER state, which should never happen.

We can't just change the max value though, as for normal operation a PD is only guaranteed to work in the VPort_PD-2P range.

Proposed:

30V - 42V = Von_PD ==> PD shall turn on in this range
30V - 36V = Voff_PD ==> PD shall turn off in this range
36V - VPort-2P min ==> PD may turn off if condition persists longer than TCUT min
VPort_PD-2P ==> PD shall stay on in this range

SuggestedRemedy

- Change VOff_PD max to 36 volt. (# This is the minimum voltage during transients)
- Add sentence after p201,line 6: "The PD shall turn off at a voltage in the range of V Off_PD." as follows:
"The PD may turn off if the voltage in the range of VOff_PD to VPort_PD-2P min persists for longer than TCUT min".

Yseboodt, Lennart Philips Lighting

Comment Type **TR** *Comment Status* **A** *PD Power*

A PD has three different parameters that govern it's maximum DC average power consumption, with precendence for the lesser value in this order:
- P_Autoclass_PD
- PDMaxPowerValue
- PClass_PD

A successful DLL negotiation disables the P_Autoclass_PD limit.

The input average power exceptions currently do not take PDMaxPowerValue into account.

In 145.3.8.2 we should cluster all of the PD power requirements (Autoclass currently sits in 145.3.6.2).

SuggestedRemedy

- Change:
"For single-signature PDs assigned to Class 6 or Class 8, when additional information ..."
to:
"For single-signature PDs assigned to Class 6 or Class 8, and PDMaxPowerValue set to 510 or above 712, when additional information..."

- Change:
"For dual-signature PDs assigned to Class 5, when additional information ..."
to:
"For dual-signature PDs assigned to Class 5 and a PDMaxPowerValue_mode(X) set above 355, when additional information ..."

- In 145.3.8.2 (line 26) change:
"The maximum average power, P Class_PD or P Class_PD-2P in Table 145-29 or PDMaxPowerValue in 145.5.3.3.3, including any peak power drawn per 145.3.8.4 is averaged over a 1 second sliding window."
to:
"The maximum average power, P Class_PD or P Class_PD-2P in Table 145-29, or PDMaxPowerValue in 145.5.3.3.3, **or P_Autoclass_PD in 145.3.6.2**, including any peak power drawn per 145.3.8.4 is averaged over a 1 second sliding window."

- Append new paragraph to 145.3.8.2:
"The PD shall not draw more power than P Autoclass_PD, unless the PD successfully negotiates a higher power level, up to the PD requested Class, through Data Link Layer classification as defined in 145.5."

- Replace on page 196-197, line 54:
"The PD shall not draw more power than P Autoclass_PD at any point until V PD falls below V Reset_PD max , unless the PD successfully negotiates a higher power level, up to the PD requested Class, through Data Link Layer classification as defined in 145.5."
by:
"The PD is restricted to a maximum power draw of P Autoclass_PD until the PD successfully negotiates a higher power level through Data Link Layer classification as defined in 145.5."

Comment Type **T** *Comment Status* **A** *PD Power*

The note under Figure 145-30 points out that a dual signature PD may have a single load. It does not indicate whether that common load is isolated from the pair-sets or not. This implies that a dual signature PD might tie Vpse- (Mode A) to Vpse- (Mode B), and leaving Vpse+ (mode A) and VPse+ (mode B) independent. This would meet all the requirements for measuring signature resistors and classification currents. Alternatively, the PD could tie Vpse+ (Mode A) to Vpse+ (Mode B) together, leaving the negative sides independent. This would also meet all the signature and classification requirements. However, the first connection would prevent the PSE from correctly measuring currents on the low side of the PSE output, and the second would prevent the PSE from measuring currents on the high side of the PSE output. Since the specification seems to allow both, there is no way to create a reliable connection check from the PSE.

It would appear that somewhere in the specification, a dual signature PD must be constrained to prevent 'sharing' of current between the two pairsets. This constraint does not appear to exist in the current draft. Recommend to explicitly add this constraint. One place to do this might be in the definition of a dual-signature PD; section 1.4.186a.

SuggestedRemedy

Page 24, SubClause 1.4, line 19

From:
1.4.186a dual-signature PD: A PD that has independent detection signatures, class signatures, and maintain power signatures on each pairset (See IEEE 802.3, Clause 145).

Change to:
1.4.186a dual-signature PD: A PD that has independent detection signatures, class signatures, and maintain power signatures on each pairset, and where outgoing and return currents related to detection signatures, class signatures, and maintain power signatures are restricted to that pairset. (See IEEE 802.3, Clause 145).

Note: this is one among several likely options for introducing this constraint into the standard. The commenter is not wed to this proposal and will likely accept any resolution that produces clear guidance.

"When transient TR1 or TR2 is applied, the PD shall meet the operating power limits after TTransient as
defined in Table 145-30."
It is unclear what exactly is meant by 'the operating power limits'. The limits could be at PSE side as well as PD side. Moreover because the voltage at the PI is no longer static the power limits at PSE and the PD are no longer "in sync". Alsothe 'after TTransient' is not clearly defined.

SuggestedRemedy

Referring back to 802.3-2015_SECTION2.pdf (p653) where "PD upperbound template" is used, the term "PSE lowerbound template" (p170-172 in Draft3.1) is related.
Also note 'TTransient' is the same as 'TLIM min'.

Replace "the operating power limits after TTransient as
defined in Table 145-30." by "the PSE lowerbound template (see Figure 145-24 and Figure 145-25)"

What is the benefit of defining TR3?
TR1 and TR2 cover long ("lasting more than 250 is") transients related to the switchover of backup power supplies.
TR3 is a very fast (0.71us is way below 250us and even 30us). For relatively fast transients related to load changes one would expect the initial and final voltage to be the same and having a lower intermediate voltage. If the fall and rise times are small, one would not expect the Cport to discharge and recharge much.
Peak currents way below Ilim are listed and expected to happen.
For the rest the definition seems completely arbitrary: where do the 5A 1.5ohm and 4ms come from. Also how should the 1.5ohm and 5A be interpreted for single signature and dual signature?
The definition of TR3 needs to be reworked completely anyhow.

SuggestedRemedy

I think it is better to just delete the TR3 requirement.

Response *Response Status* **U**

REJECT.

The comment resolution group believes that deleting the requirement can lead to system interoperability issues.

Zimmerman, George — Aquantia, ADI, Comm

Comment Type **TR** *Comment Status* **A**

"The PD PI connector (jack) when mated with a specified balanced cabling connector (plug) shall meet the requirements of 145.3.8.9" - this is nonsensical. This is a dual of a comment on 145.2.8.5.1. There is actually only one other requirement (one for single-sig, and the same for dual-sig) listed in 145.3.8.9 and I believe the intent is that that requirement should be stated so that it applies when the PD PI is mated to the specified balanced cabling connector.

SuggestedRemedy

delete page 205 lines 50-51 (the quoted sentence in the comment), and insert new paragraph after the sentence ending on line 34 of page 206 (previous paragraph begins on line 29 "Dual-signature PDs shall not exceed..."), new paragraph to read ""The unbalance current requirement for both single-signature and dual-signature PDs applies at the PD PI connector (jack) when mated with a specified balanced cabling connector (plug)."

Response *Response Status* **W**

To ensure proper operation of connection check and detection, we need to require that PSE measures the current on the same side it switches the current
(We have already a requirement that PSE will switch the current on the negative side. Switching the positive side is possible as an option but not instead of the negative side).
The PD must show valid detection on each pairset set per the dual-signature definitions when connected to the PSE above.
As a result, we don't need to require dual-sigs to not tie negatives together however if we do, it surely make the standard clearer.
In addition 79.3.2.6d.3 needs updated and will be addressed in separate comment marked as PDISO-1.

SuggestedRemedy

1) On page 210 line 7, change from:
"An Environment A PSE shall switch the more negative conductor. It is allowed to switch both conductors."
To: "An Environment A PSE shall switch the more negative conductor and shall measure the current through it. It is allowed to switch both conductors."
2) On page 210 line 18, change from:
"An environment B PSE that supports 4-pair power shall switch the more negative conductor. It is allowed to switch both conductors."
To:
"An environment B PSE that supports 4-pair power shall switch the more negative conductor and shall measure the current through it. It is allowed to switch both conductors."
3) On page 209 clause 145.4.1 after line 38, add the following text: ODual-signature PDs shall not tie the negative pairs during detection and classification states.O

There is a basic timing issue in DLL power negotiations which is currently not addressed.

When a PD negotiates power DOWN:
- it must conform to the newly requested power immediately as the requests goes out (through pd_max_power)
- it must wait for the PSE to be in sync before it triggers power update (otherwise it can flip to lower MPS current before the PSE is ready for it)

When a PD negotiates power UP:
- it must wait for the PSE to be in sync before changing pd_max_power
- it must immediately trigger power update to conform to potentially higher MPS requirements as the request goes out

SuggestedRemedy

This issue, as well as the Autoclass DLL issue is addressed in yseboodt_05_0117_dllautoclass.pdf.

Adopt yseboodt_05_0117_dllautoclass.pdf

There is a basic conflict between DLL power negotiation and Autoclass.
This is what happens:

CC, Detect, Class happens. An initial Class is assigned and power allocated. Assume the PD requests Autoclass
The PSE performs the Autoclass measurement and based on this reduces the power budget.
DLL is initialized
Per the DLL state diagrams, the PSE uses a PSE_INITIAL_VALUE based on the assigned Class.
At this point the Autoclass optimization is forgotten... after all, whatever power the PSE puts in PSEAllocatedPowerValue is the amount of power the PSE guarantees at the PD PI.

The same happens when DLL Autoclass is used, right after the measurement, the result is invalidated because the value in PSEAllocatedPowerValue prevails.
The root cause of this is that DLL always requires both PSE and PD to negotiate to some value. The whole point of Autoclass is that neither party necessarily knows about cable resistance and power at the PD PI.

We need a way to indicate at DLL level that Autoclass is being used and that the normal DLL operation is suspended.
Ideally what I would want is that a PD or PSE can, at any time, switch out of this mode and go back to "normal" power allocation.
Thus, I would suggest that we take a magic number for the PDRequestedPowerValue and PSEAllocatedPowerValue fields that indicates that the power allocation = the most recent Autoclass power.
A logical value for this would be 0xACAC.

So, what would happen after a Physical Layer Autoclass is that the PD initializes with a PDRequestedPowerValue=0xACAC which indicates Autoclass.
The PSE, if it supports Autoclass, would use PSEAllocatedPowerValue=0xACAC.
If it doesn't, the PSE can set PSEAllocatedPowerValue to the assigned Class.

This way, a PD that operates under Autoclass, is able to 'renegotiate' to a fixed PD PI value, and then later on even redo Autoclass using DLL.

SuggestedRemedy

The way the subclauses are ordered in 145.5.3 (DLL state diagrams) no longer makes sense with the particular implementation of DLL we have adopted in the last cycle.
Right now everything is structured with single-signature vs dual-signature as the top branch.

SuggestedRemedy

Restructure 145.5.3 such that:
- The top branch is PSE and PD
- Subdivide PD into single-signature and dual-signature
- Create a single mapping Table for PSEs with ALL the variables (the regular ones and the _alt(X) ones)
- Merge the variable lists for the PSE
- Create two mapping Tables for PDs (one for single-signature and one of dual-signature)
- Remove the construct _alt(X=A) or _mode(X=B) from the dual-signature mapping table, replace by _alt(A) or _mode(B).

"diagram" was changed to "diagrams" in the previous paragraph, but this paragraph still has "diagram" referring to two different diagrams, twice.

Also, figure 145-42 (as numbered in the clean document) seems to deal with Autoclass, which is optional. Is the "shall" appropriate for it too? Is there a parallel requirement for Dual-signature PD? (I am not sure about this)

SuggestedRemedy

Change "diagram" to "diagrams" twich in the second paragraph.

Consider what to do with the Autoclass state diagram.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change "diagram" to "diagrams" twice in the second paragraph.

In Table 145-41 we find the mappings between state diagram variables and Clause 30 objects.
For dual-signature, we've used the notation "PDRequestedPowerValueEcho_alt(X=A)" to indicate we refer to variable PDRequestedPowerValueEcho_alt(A).

Given that we now also use "P" as a variable pointing to the active state diagram, this notation no longer feels right.

SuggestedRemedy

Replace in Table 145-41 every instance of "(X=A)" with "(A)" and "(X=B)" with "(B)".

Skinner, John

Comment Type **E** *Comment Status* **A** *DLL*

The statement "When the PSE is not in sync with the PD, the PSE is allowed to change its power allocation." is too broad, based on the conditions shown in Figure 145-39. The transition from PSE_POWER_REVIEW to MIRROR_UPDATE is governed by the conditions: Either (pse_new_value < PSEAllocatedPowerValue) OR (PSEAllocatedPowerValue=MirroredPSEAllocatedPowerValueEcho). Therefore, the transition can only occur when the PSE is reducing the allocation OR when the PSE and PD are in sync.

SuggestedRemedy

Change the statement in line 20 to "When the PSE is not in sync with the PD, the PSE is allowed to reduce its power allocation.". Alternatively, remove the statement, as the conditions are correctly discussed in the paragraph starting on line 23.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Comment Type **T** *Comment Status* **A** *DLL*

"The PSE and PD utilize the LLDPDUs"

LLDPDUs are data blocks sent over the LLDP protocol. They contain many other things, not just PSE and PD stuff.

It would be more adequate to refer to the Power over MDI TLV, or alternatively to the LLDP protocol.

Also, a cross-reference would be useful.

SuggestedRemedy

Change "utilize the LLDPDUs" to either:
"Utilize the Power over MDI TLV (See 79.3.2)"
or
"Use the LLDP protocol (See Clause 79)"

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change to: "use the LLDP protocol (See Clause 79)"

Skinner, John

Comment Type **E** *Comment Status* **A** *DLL*

The statement "When the PSE is not in sync with the PD, the PSE is allowed to change its power allocation." is too broad, based on the conditions shown in Figures 145-43 and 145-44. The transition from PSE_POWER_REVIEW to MIRROR_UPDATE in Figure 145-43 is governed by the conditions: Either (pse_new_value_alt(X) < PSEAllocatedPowerValue_alt(X)) OR (PSEAllocatedPowerValue_alt(X)=MirroredPSEAllocatedPowerValueEcho_alt(X)). The transition from PSE_POWER_REVIEW to MIRROR_UPDATE in Figure 145-44 is governed by the conditions: Either (pse_new_value_alt(P) < PSEAllocatedPowerValue) OR (PSEAllocatedPowerValue=MirroredPSEAllocatedPowerValueEcho). Therefore, in both cases, the transition can only occur when the PSE is reducing the allocation OR when the PSE and PD are in sync.

SuggestedRemedy

Change the statement in line 4 to "When the PSE is not in sync with the PD, the PSE is allowed to reduce its power allocation.". Alternatively, remove the statement, as the conditions are correctly discussed in the paragraph starting on line 7.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Remove quoted sentence.

Skinner, John

Comment Type **E** *Comment Status* **A** *DLL*

The statement "...the PSE may update the PSEAllocatedPowerValue and follow the procedure in 145.5.5.1." only defines how to update Single Signature devices. There are no apparent limitations discussed in 145.2.7.2 or 145.3.6.2 (or the state diagram Figure 145-13) regarding Autoclass being solely used with single Signature Devices.

SuggestedRemedy

Modify the statement to add a reference to the PSE state change procedure across a link (dual signature) "...the PSE may update the PSEAllocatedPowerValue and follow the procedure in 145.5.5.1 (single signature) or 145.5.6.2 (dual signature)."

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Editor to note in sections 145.2.7.2 and 145.3.6.2 that AutoClass is only supported by SS PDs.

Item "*MID" has status "O/1" which means it is mutually exclusive with item "*CL" (per 21.6.2 definition: "one and only one of the group of options labeled by the same numeral <n> is required"

Is Midspan PSE incompatible with "Implementation supports Physical Layer classification"?

From reading the corresponding subclauses, 145.2.3 and 145.2.7, it isn't clear to me why this is so.

I suspect that the table is garbled and there should be mutually exclusive items for alternative A and alternative B (which currently does not appear at all), while Physical layer classification is simply optional.

SuggestedRemedy

Edit the PICS item list to make it correct.

If there is indeed a reason for this mutual exclusion, include clear statements in the referenced subclauses.

Response *Response Status* **C**
