omment Type T Comment Status X	Comment Type T Comment Status X
"This bit enables the 25GBASE-R Reed-Solomon FEC described in Clause 108" - it is much clearer, when bit number is referenced explicitly rather than implicitly.	"The PCS service interface is precisely defined as the 25GMII in Clause 106" - this makes me wonder whether other elements of 25G PHY are defined less precisely than PCS
lggestedRemedy	service interface quantifiers of this type are meaningless. PCS service interface is the 25GMII. Period.
Change to "Bit 1.200.2 enables the 25GBASE-R Reed-Solomon FEC described in Clause 108". Similarly, change "When set to a zero, this bit disables the" to "When set to a zero, bit 1.200.2 disables the"	SuggestedRemedy Remove the word "precisely" from the selected statement.
Similar changes to be applied to 45.2.1.101.1, 45.2.1.101.2, and other locations in Clause 45 where reference to "this bit", "this register", etc. is made implicitly. Explicit references are much clearer to reader and leave no need for context based interpretation.	Proposed Response Response Status O

Considering there is a huge bank of register bits (1 1 0 x x x) shown as reserved, it mines be good to provide an editor's note (to be removed prior to publication) to explain the good to prevent sponsor ballot reviewers from suggesting changes to optimize.

Comment Type TR Comment Status X	Comment Type TR Comment Status X
The conformance requirements for this clause are very light and poorly captured in the PICS.	The wording in the PICS entry for RF3 and RF4 does not match the text in 108.5.3.2. Bypass is an optional mode of operation, and does not impact the requirement of RS-FEC.
SuggestedRemedy	SuggestedRemedy
Change the paragraph to read: "The 25GBASE-R PCS shall support all the functionality of the 10GBASE-R PCS specified in Clause 49. In addition, the PCS shall support the scrambled idle test pattern generator specified in 82.2.11."	Combine RF3 and RF4 into one PICS entry that has the following entries: RF3; Reed-Solomon decoder; 108.5.3.2; Corrects any combination of up to 7 symbol erros in a codeword; M; Yes[] Proposed Response Response Status <b>O</b>
In 107.6.3, for the MD entry, add 49.2.14 to the subclause list.	
Change 107.6.4 to be 25G PCS and delete table in 107.6.4.	C/         108         SC         108.7.4.2         P         123         L         17         #         112           Booth, Brad         Microsoft         Microsoft
Change 107.6.4.1 to be Clause 49 Functionality Use the following entries into the table: PCS1; Supports Clause 49 functionality; 107.2; ; M; Yes[] No[]	Comment Type <b>TR</b> Comment Status <b>X</b> RF5 is confusing. Error correction bypass is optional, but it's mandatory that SR not support it. I'm concerned that this could be incorrectly interpreted.
Add 107.6.4.2 Test Pattern Generator Use the following entries in the table:	SuggestedRemedy
TP1; Scrambled idle test pattern; 107.2, 82.2.11; ; M; Yes[] No[] TP2; Scrambled idle ability; 107.2.3; ; M; Yes[] No[]	Change RF5 to read: RF5; Error correction bypass; 108.5.3.2; Error correction bypass not supported by 25GBASE-SR; BEC*!SR:M; Yes[] No[] N/A[]
Change 107.6.4.2 LPI to be 107.6.4.3 LPI Change LP1 in table to be LP2 and change LPI:M to be LPI:O (deep sleep is optional) and add N/A[] to Support	Proposed Response Response Status O
Insert LP1 with the following entries in the table: LP1; EEE deep sleep; 107.3, 49; PHY configured for deep sleep operation; LPI:O; Yes[]	C/ 108 SC 108.5.3.2 P 111 L 1 # 113
No[] N/A[]	Booth, Brad Microsoft
Add LP3 with the following entries: LP3; EEE fast wake; 107.3; Fast wake operation; LPI:M; Yes[] No[]	Comment Type TR Comment Status X
Proposed Response Response Status <b>O</b>	RF7 in the PICS table talks about the corruption of the header. The text in 108.5.3.2 actually has two shall statements associated with it which have different requirements. This could be greatly simplified by editing the text to result in one shall statement to cover the operation.
	SuggestedRemedy
	Change the first sentence of the paragraph to read: "The Reed-Solomon decoder shall indicate errors to the PCS sublayer by intentionally corrupting 66-bit block synchronization headers." Change the next two occurrences of "it shall ensure" to be "it ensures".
	Proposed Response Response Status <b>O</b>

The /I/ means Idle control character so it's unnecessary to include the word character in b). However this is also the first usage of /I/ and /LI/ in clause 108 so.	With a Clause 49 LPI state diagram you can exit LPI state without ever going to sleep (path from SLEEP -> ACTIVE exists).				
SuggestedRemedy	In rapid align is get to true whenever $r_{i}$ by active is get to true, which accure when $\frac{1}{1}$				
Delete "characters," from 108.5.3.6 item b)	lpi_rapid_align is set to true whenever rx_lpi_active is set to true, which occurs when /Ll/ are seen. So if the Tx sends some /Ll/ but doesn't actually go to sleep lpi_rapid_align				
In 108.5.2.2 change b) to read: b) Delete /l/, /Ll/ and ordered sets, according to the rules in 49.2.4.7 and 49.2.4.10, to create room as necessary for the periodically occurring codeword markers or	could be set. The only way to clear lpi_rapid_align is to successfully achieve alignment with rapid CWMs. Addiitionally while in the 2_GOOD state you would reset the lpi_rapid_align setting baed on rx_lpi_active being TRUE, if it changes to FALSE (transition from /l/ to /Ll/ during WAKE) then you'd also end up stuck trying to frame to rapid CWMs				
b) Delete Idle control characters (/I/), Low Power Idle control characters (/LI/) and ordered	SuggestedRemedy				
sets, according to the rules in 49.2.4.7 and 49.2.4.10, to create room as necessary for the periodically occurring codeword markers	Add the assignment of lpi_rapid_align <= rx_lpi_active in the 2_GOOD state of Figure 108-6				
Proposed Response Response Status <b>O</b>	Change the definition for lpi_rapid_align to be: Boolean variable that is set according to the FEC synchronization state diagram in Figure 108 6.				
	Add a WAKE_FAIL state to Figure 108-6 which is entered if the hold-off timer defined in 108.5.3.7 expires and sets lpi_rapid_align <= false and transitions to the LOCK_INIT state via a UCT transition				
	Create a definition for the Rx EEE hold_timer in 108.5.4 to be referenced by Figure 108-6 and 108.5.3.7

The current COM parameter does not include Low-Frequency CTLE (LF-CTLE) which is a state-of-the-art analog equalizer. LF-CTLE has a pair of pole and zero in much lower frequency than the CTLE of the current COM parameter. The LF-CTLE significantly	bmax(n) is specified as 0.5 for CA-N. This is to prevent error propagation caused by DFE.
reduces BER, and is already in some implementations in the market. The LF-CTLE is also known as a long-tail equalizer. The LF-CTLE is particularly effective for skin effect, and hence for cable appliations. With LF-CTLE, we can easily support 3m cable without FEC	However, a burst error does not matter for CA-N, because FEC is not used. Once there is an error, no matter whether a single-bit error or a burst error, the entire frame is dropped b a check sum error.
with solid high confidence, still maintaining 3dB COM margin in the same way as before without any compromise.	SuggestedRemedy
without any compromise.	Change bmax(n) value for CA-N to 1.
However, since the current COM parameter does not include LF-CTLE, there are no 3m cable assembly that passes 3dB COM test, although there are many good-enough 3m cable assembly, unless we make some compromise such as lowering 3dB COM criteria.	Proposed Response Response Status <b>O</b>

"shielded copper balanced cabling" is usually "shielded balanced copper cabling" (see 40GBASE-CR4 for example). Additionally, this description "shielded balanced copper cabling" is nowhere in clause 110 which defines the PMDs.				"For operation at 10 Gb/s (insert 'or greater speed') (strikeout '40 Gb/s, and 100 Gb/s')" presumes choices made at other speeds under development or yet to be balloted (400Gb/s, possible 50 Gb/s, 200 Gb/s, etc.). adding in 25Gb/s speed only remains within the scope of this project. ### Comment Type T Comment Status X

A PHY operating in no-FEC mode can have unexpected bad performance and higher than desired BER. The BER of an active no-FEC link is not readily observable, so this situation may be difficult to detect and handle.

When a PHY operates in either BASE-R FEC or RS-FEC mode, performance of an active link can be reliably monitored by periodically reading information available within the PHY - either directly using the uncorrectable codeword counters, or indirectly reading the corrected block/symbol error counters, and estimating the underlying PMD BER.

In contrast, in no-FEC mode, the only error information available in the PHY is the PCS errored block counter (49.2.14.2). This counter advances only for errors that occur on control blocks (corrupted start or end of frame or IPG), and does not advance when errors occur in data blocks (these errors are expected to be detected in the MAC by corrupted CRC).

Therefore, in no-FEC mode, the BER cannot be calculated from PHY information without knowing the link utilization level (relative portion of data blocks out of the total received blocks). Similarly, it cannot be precisely calculated by counting the MAC CRC error counters, since these counters count frames and the frame lengths are missing from the calculation. Also, the MAC error counting functionality or even the MAC itself may not exist.

In order to enable more accurate performance estimation, a counter of PCS control blocks is required. Given such a counter, the PCS block error ratio can be calculated simply by reading and dividing the values of the errored block counter and the control block counter.

Such a counter should be wide enough to enable infrequent monitoring without clipping. At 25 Gb/s, a 48-bit counter of PCS blocks can count for more than 8 days; its least significant 16-bit part would wrap around in less than 1 second, so reading obly its most significant 32 bits provides sufficient information.

Implemenation of this counter can be optional.

#### SuggestedRemedy

Add a counter definition (in a new subclause as necessary) with definition:

control\_block\_count - 48-bit counter. When the receiver is in normal mode, control\_block\_count counts once for each time either RX\_C or RX\_T states are entered. Implementation of this counter is optional.

Insert new subclause 45.2.3.51, and define two new MDIO registers 3.1809, 3.1810 (or other addresses) for accessing the most significant 32 bits of the counter (multi-word, self-clear).

Comment Type T Comment Status X

The base document includes the following requirement, which may cause incorrect AN functionality with break-out cables or when multiple single-lanes are desired by the partner:

"When the MDI supports multiple lanes, then lane 0 of the MDI shall be used for Auto-Negotiation and for connection of any single-lane PHYs (e.g., 1000BASE-KX or 10GBASE-KR)."

With a break-out cable, and in some cases with QSFP-QSFP too, four separate links should be created. If AN is not programmed specifically to create this configuration, AN would only be used (transmitted and received) in lane 0, and other lanes would have to be forced to the desired mode, which defeats the purpose of AN. Requiring AN to be reprogrammed according to the detected cable type also defeats the purpose of AN, and furthermore, this won't help for the case of creating four single-lane links over a quad-lane cable.

A simple solution would be to allow AN to look for incoming AN communication on every lane that can create a single-lane link. when AN is detected on a lane other than lane 0, this could create a single-lane link using that lane. behavior following this event can ensure that multiple single-lane links are created, without a need to re-program the AN registers.

#### SuggestedRemedy

The sentence quoted should be changed. A detailed presentation will be supplied.

Comment Type т Comment Status X

The 25G FEC operation as specified here and in clauses 110, 111 is symmetric. This forces the link to have FEC in both directions when one PHY requests FEC even if the other PHY does not.

There are cases where this symmetry is a burden:

- Some applications may prefer low BER in one direction and low latency in another direction.

- It is possible that one of the PHYs has a better receiver or a better channel quality for its receiver, and can operate without FEC, but is forced to use FEC because of the other PHY which has a minimally complant receiver or worse channel quality.

In these cases the symmetry requirement doubles the round-trip latency and possibly imposes a larger performance impact than using FEC only in the direction where it's needed.

Technically there is no problem in having a link with one direction operating with one FEC mode, and the other direction operating in another, since the TX and TX data paths are independent. Asymmrtrical FEC can be accomplished with the existing AN FEC request bits, and the existing FEC mode definitions in clauses 110 and 111, by separating the FEC modes to transmit and receive directions.

### SuggestedRemedy

Detailed presentation to be supplied.

Proposed Response Response Status 0 Comment Type T Comment Status X

We should allow advertisement of 10GBASE-KR along with copper cable assemblies such as 40GBASE-CR4 and 100GBASE-CR4.

Although 802.3 has no specification of a 10 Gb/s PHY for copper cable assembly, in practice, 10GBASE-KR can be advertised and can operate over this medium as well.

This project has removed the distinction between 25G for backplane and for copper cable asssemblies in AN. As a result, a 4-lane device that supports 25G and 10G on each lane could practically advertise 100GBASE-CR4 (A8), 40GBASE-CR4 (A4), 25GBASE-CR/KR (A10) and 10GBASE-KR (A2) so that it could link with various partners over various cable types, enabling wider interoperability and applicability (e.g. 4 to 1 breakout at either 25G and 10G on each lane).

However the current text in 73.6.4 specifically prohibits this kind of adertisement, since 10GBASE-KR is specified for backplanes while 100GBASE-CR4 and 40GBASE-CR4 are specified for copper cable assemblies.

There seems to be no reason for this limitation. Removing it as suggested below would enable using 10GBASE-KR over copper cable assmblies with full AN support, and partly rectify the unfortunate lack of an 802.3 standard for 10G Ethernet over this medium.

A minimal change that would have the desired effect is to limit the restriction to apply only for backplane and CCA PHYs of the same data rate. If that is done, then 10G PHYs and below, which have no copper cable assembly counterparts, should not be listed.

The two lists of PHYs are comprehensive and should not be preceded by "e.g.".

### SuggestedRemedy

Change "with a PHY for operation over a copper cable assembly" To "with a PHY for operation over a copper cable assembly of the same data rate".

Delete "e.g., 1000BASE-KX, 10GBASE-KX4, 10GBASE-KR" from the first parentheses.

Delete "e.g., " from the list of copper cable assembly PHYs.

Alternatively, completely delete the third paragraph.

## Comment Type T Comment Status X

To support the enumerations '25GBASE-CR', '25GBASE-CR-S', '25GBASE-KR' and '25GBASE-KR-S' when a Clause 45 MDIO interface is present, the new RS-FEC control register defined in subclause 45.2.1.101 needs to be accessed to determine if RS-FEC is enabled or not. Based on this a reference to subclause 45.2.1.101 'RS-FEC control register' should be added to the list of register.

### SuggestedRemedy

Change the text '... the PMA/PMD control 1 register specified in 45.2.1.1, and the PCS control 1 register ...' to read '... the PMA/PMD control 1 register specified in 45.2.1.1, the 25G RS-FEC Enable bit in the RS-FEC control register, and the PCS control 1 register ...'.

Proposed Response	Response Status	ο

CI 030	SC 30.5.1.1.4	P <b>30</b>	L <b>30</b>	# 217	
Law, David	d	HP			

### Comment Type T Comment Status X

Since IEEE P802.3by uses the 10Gb/s RS (see subclause 106.1 'Overview') suggest it would be better to modify the 10Gb/s text to add 25Gb/s rather than the 40Gb/s and 100Gb/s text. As an aside, I think the reference to Figure 46-11 in the currently 40Gb/s and 100Gb/s text should be to Figure 81-9 since Clause 81 is the 'Reconciliation Sublayer (RS) and Media Independent Interface for 40 Gb/s and 100 Gb/s operation (XLGMII and CGMII)' and since subclause 81.3.4, which is also referenced, states 'The RS shall implement the link fault signaling state diagram (see Figure 81-9).'.

### SuggestedRemedy

Suggest that:

[1] The change on line 30 is removed so the text reads 'For 40 Gb/s and 100 Gb/s the enumerations  $\ldots$  '.

[2] The text on line 42 is changed to read 'For 10 Gb/s the enumerations ...' to read 'For 10 Gb/s and 25 Gb/s the enumerations ...'.

Proposed Response Response Status O

Cl 045	SC 45.2.3.14.1	P <b>47</b>	L 33	# 218

### Comment Type T Comment Status X

Subclause 45.2.3.14.1 'Latched block lock (3.33.15)' states that 'When read as a one, bit 3.33.15 indicates that the 10/40/100GBASE-R or the 10GBASE-T PCS has achieved block lock.'. Subclause 45.2.3.14.2 'Latched high BER (3.33.14)' states that 'When read as a one, bit 3.33.14 indicates that the 10/40/100GBASE-R or the 10GBASE-T PCS has detected a high BER.'. Subclause 45.2.3.14.3 'BER(3.33.13:8)' states that 'The BER counter is a six bit count as defined by the ber\_count variable in 49.2.14.2 and 82.2.19.2.4 for 10/40/100GBASE-R ...'.

Since the 25GBASE-R PCS uses the 10GBASE-R PCS (see subclause 107.1.2) it would seem that these bits should also support 25GBASE-R, and hence the description of these bits updated to reflect this.

## SuggestedRemedy

Suggest instances of the text '10/40/100GBASE-R' be changed to read '10/25/40/100GBASE-R' or simply 'BASE-R'.

Proposed Response Response Status **O**

### Comment Type T Comment Status X

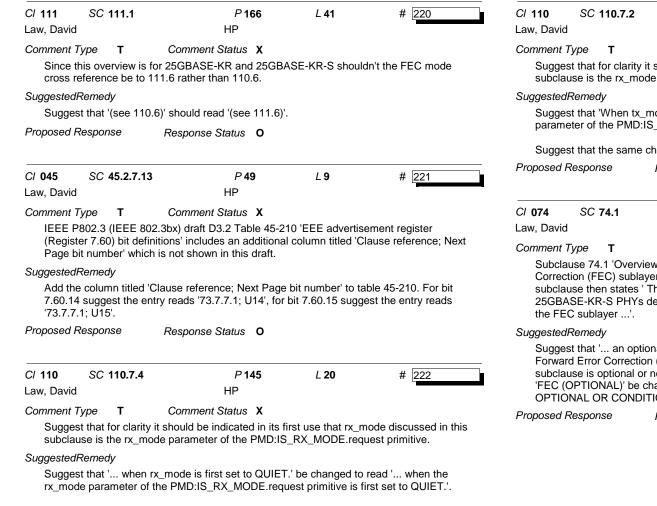

Subclause 45.2.3.13.1 'BASE-R and 10GBASE-T receive link status (3.32.12)' states that 'This bit is a reflection of the PCS\_status variable defined in 49.2.14.1 for 10GBASE-R ...'. Subclause 45.2.3.13.4 'BASE-R and 10GBASE-T PCS high BER (3.32.1)' states that 'This bit is a direct reflection of the state of the hi\_ber variable in the 64B/66B state diagram and is defined in 49.2.13.2.2 for 10GBASE-R'. Subclause 45.2.3.13.5 'BASE-R and 10GBASE-T PCS block lock (3.32.0)' states 'This bit is a direct reflection of the state of the block\_lock variable in the 64B/66B state diagram and is defined in 49.2.13.2.2 for 10GBASE-R'. Subclause 45.2.3.13.5 'BASE-R and 10GBASE-T PCS block lock (3.32.0)' states 'This bit is a direct reflection of the state of the block\_lock variable in the 64B/66B state diagram and is defined in 49.2.13.2.2 for 10GBASE-R...'. Subclause 45.2.3.14.4 'Errored blocks (3.33.7:0)' states 'The errored blocks counter is an eight bit count defined by the errored\_block\_count counter specified in 49.2.14.2 for 10GBASE-R ...'.

Since the 25GBASE-R PCS uses the 10GBASE-R PCS (see subclause 107.1.2) it would seem that these bits should also support 25GBASE-R, and hence the description of these bits updated to reflect this.

### SuggestedRemedy

Suggest '... for 10GBASE-R ...' be change to read '... for 10GBASE-R and 25GBASE-R ...'.

Proposed Response Response Status O

Suggest that the same change be made to subclause 111.7.4 (page 171, line 12).

Proposed Response Response Status 0

### Comment Type TR Comment Status X

Suggest that the 25GBASE-KR and 25GBASE-KR-S overview provide similar text to the third paragraph of the 25GBASE-CR and 25GBASE-CR-S overview (see 110.1), that is a summary of which channels 25GBASE-KR and 25GBASE-KR-S operate over, as well as a statement that a 25GBASE-KR PHY can interoperate with a 25GBASE-KR-S PHY. The latter is implied, but not stated, in the second paragraph of subclause 111.9 'Channel characteristics' since it discusses links that comprise of one 25GBASE-KR-S PHY.

### SuggestedRemedy

Suggest that:

[1] A new subclause heading of 111.9.1 'Two 25GBASE-KR PHY channel' be added above the first paragraph of 111.9 (page 175, line 21).

[2] A new subclause heading of 111.9.2 '25GBASE-KR-S PHY channel' be added above the second paragraph of 111.9 (page 175, line 25).

[3] A new third paragraph be inserted in 111.1 'Overview' below the table (page 166, line 39) that reads 'A 25GBASE-KR PHY supports operation over a channel meeting the requirements of 111.9.1 or 111.9.2. A 25GBASE-KR-S PHY only supports operation over a channel meeting the requirements of 111.9.2. A 25GBASE-KR-S PHY interoperates with a 25GBASE-KR PHY.'.

[4] Change the text '... the requirements of 111.9.' to read '... the requirements of 111.9.1 or 111.9.2.' in subclause 111.1 (page 166, line 51).

[5] Change the subclause entry for PICS item CC1 (page 181, line 41) from 111.9 to 111.9.1.

[6] Change the subclause entry for PICS item CC2 (page 181, line 44) from 111.9 to 111.9.2.

Proposed Response Response Status **O**

Law, David		HP			

### Comment Type **TR** Comment Status **X**

The third paragraph of subclause 110.1 'Overview' states that 'A 25GBASE-CR-S PHY interoperates with a 25GBASE-CR PHY'. Further, subclause 111.9 'Channel characteristics' implies that a 25GBASE-KR PHY can interoperate with a 25GBASE-KR-S PHY since it discusses links that comprise of one 25GBASE-KR-S PHY. The changes to Table 73-4 'Technology Ability Field encoding' however defines separate bits for 25GBASE-KR-S KR-S or 25GBASE-CR-S (bit A9) and 25GBASE-KR or 25GBASE-CR (A10).

IEEE P802.3 (IEEE 802.3bx) draft D3.2 subclause 73.7.6 'Priority Resolution function' states that 'The single PHY enabled to connect to the MDI by Auto-Negotiation shall be the technology corresponding to the bit in the Technology Ability Field common to the local device and link partner that has the highest priority as defined in Table 73-5 (listed from highest priority to lowest priority).' and that 'In the event that there is no common technology, HCD shall have a value of "NULL", indicating that no PHY receives link\_control=ENABLE and link\_status[HCD]=FAIL.'

Based on above, if the local device is a 25GBASE-CR-S PHY, and its link partner is a 25GBASE-CR PHY, there will be no bit in the Technology Ability Field common to the local device and link partner, and as there is no common technology I don't believe the link will come up.

### SuggestedRemedy

Either add text to subclause 73.7.6 'Priority Resolution function' to cover the cases of 25GBASE-KR/25GBASE-KR-S and 25GBASE-CR/25GBASE-CR-S interoperability. Alternatively, define a single bit for 25GBASE-KR-S, 25GBASE-CR-S, 25GBASE-KR and 25GBASE-CR since there is only one variable defined for all four in the subclause 73.10.1 'State diagram variables' changes (page 59, line 39).

This sub-clause purports to define the MDI but does not do that. It defines the MDI device or MDI connector but not the INTERFACE. It is the interface, not the interface connector which is the MDI. SuggestedRemedy Change either the title of the sub-clause or the contents so that the title and contents match.	Both measurement types A and B rely on definition and explanations listed on: "83E.4.2 Eye width and eye", but there is no reference to that section. While it is true that you could find the origin of these if you travel through pointers, but that's quite clumsy.
	SuggestedRemedy
Proposed Response Response Status O	Prior to both methods, add a reference to 83.E.4.2 and preferably some words, for examp "Measurement methods A and B rely on definitions and explanations given in 83E.4.2. The reader is
C/ 110 SC 110.10.7 P 154 L 9 # 238	advised to consult 83E.4.2 for more details."
Dmer Sella Mellanox	Proposed Response Response Status <b>O</b>
This comment refers to table 110-10. While there is no conflict here, some of the parameters in table 110-10 are the same as in Table 93-8. It may be confusing for a reader trying to find a change in these parameters when there is none.	C/       110       SC       110.8.4.2       P 147       L 37       # 240         Omer Sella       Mellanox       Mellanox       Mellanox       Mellanox         Comment Type       T       Comment Status       X       Mellanox
Only the "Alien far-end aggressor", "Near-end aggressor:, "Normalized DFE coefficient" and "Target detector error ratio" are different. SuggestedRemedy	The receiver test does not seem to address the QSFP form factor case (or at least separately from SFP). Figure 110-3 depicts the setup for what seems to be only the SFP-SFP case, but I don't provide the setup for what seems to be only the SFP-SFP case.
and "Target detector error ratio" are different.	separately from SFP). Figure 110-3 depicts the setup for what seems to be only the SFP-SFP case, but I don't see in either words or figures a test setup for the QSFP-QSFP case. SuggestedRemedy
and "Target detector error ratio" are different. SuggestedRemedy Leave only the differences from table 93-8, delete the rest. We may still want to leave in remark 'a' just below the table, maybe incorporate it into the body of the	separately from SFP). The criteria of COM value to be 3dB reserves too high margin. Simulation result indicates the following: When COM is 3dB with DER0=1E-12, BER is < 1E-66. When COM is 3dB with DER0=1E-6, BER is < 1E-18. When COM is 3dB with DER0=1E-5, BER is < 1E-13. When COM is 3dB with DER0=3E-4, BER is < 1E-8.	According to Clause 107.2, the scope of test pattern support includes those specified in Clause 49 (for generation and checking), plus scrambled idle (for generation only). In 107.2.3, the following sentence appears: "The PCS shall have the ability to generate a scrambled idle test pattern." To reinforce inclusion of the generated test patterns specified in Clause 49, it is suggeste to broaden the scope of the current statement in Clause 107.2.3.
We should not reserve so high margin for COM.	SuggestedRemedy
SuggestedRemedy Change the COM criteria for the channel as "greater than or equal to 1dB".	The following editorial update is suggested: "In addition to those patterns specified in 49.2.8, the PCS shall have the ability to genera a scrambled idle test pattern."

This comment was received after the close of ballot.	C/ 107 SC New P 100 L 34 # 244
C/ 109 SC 109.4.5 P 133 L 14 # 242	Butter, Adrian IBM
Butter, Adrian IBM	Comment Type E Comment Status X
Comment Type       E       Comment Status       X         In 109.4.5 Energy Efficient Ethernet for 25GAUI, the first sentence states: "When the optional Energy Efficient Ethernet (EEE) deep sleep capability is supported and the PMA service interface is physically instantiated as 25GAUI, the additional functions listed in this subclause are required."         It is noted that since the "additional functions" do not directly appear in subclause 109.4.5, the current wording lacks clarity.	According to Clause 107.2, the scope of test pattern support includes those specified in Clause 49 (for generation and checking), plus scrambled idle (for generation only). To reinforce inclusion of the checked test patterns specified in Clause 49, it is suggested to include a test patern checking subclause. SuggestedRemedy Add the following subclause and associated text:
SuggestedRemedy	"107.2.4 Test-pattern checker
Indete the contenes to directly reference these additional functions.	The PCS shall provide test pattern checking abilities in accordance with 49.2.12."
Update the sentence to directly reference these additional functions:	
"When the optional Energy Efficient Ethernet (EEE) deep sleep capability is supported and the PMA service interface is physically instantiated as 25GAUI, the additional functions listed in 83.5.11 are required."	Proposed Response Response Status O
