Zimmerman, George — CME Consulting

Comment Type **ER** *Comment Status* **A** *BZ Order*

It is now clear that BQ will precede BZ to sponsor ballot. References to text also inserted by BQ may be deleted, and edits should be on text as modified by BQ.
"Editor's note (to be removed prior to publication) - this definition is added in IEEE P802.3bq - if this amendment precedes 802.3bq into sponsor ballot, change instruction to "insert" and incorporate full definition in bz without 40GBASE-T (or 25G) and change "bq" to a "change" instruction to add the appropriate speeds."

SuggestedRemedy

Remove editor's notes and text inserted that is also in BQ.
Revert text flagged by these notes to be edits on text in 802.3bq draft out of this meeting.
Change editing instructions where edits are on text as modified by BQ to state that the edit is 'on text modified by 802.3bq'
Editor to track changes in 802.3bq drafts and comment/modify text in bz to keep alignment.
(MASTER COMMENT ON ALIGNING WITH 802.3BQ)

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
(BQ accepted)
Nomenclature: "on text as modified by IEEE Std 802.3bq-201x"

Law, David — Hewlett Packard Enterp

Comment Type **E** *Comment Status* **A** *BQ Align*

Shouldn't the entry for 'MultiGBASE-T' be placed between the entry for IEEE Std 802.3-2015 1.4.277 'mixing segment' and 1.4.278 'multiport device'. If this is correct, it should be noted that IEEE P802.3bn is adding the entry '1.4.277a modulation error ratio (MER)'.

SuggestedRemedy

Suggest that the text '1.4.278a MultiGBASE-T' be changed to read '1.4.277b MultiGBASE-T'. Note that this subclause number may need to be swapped with IEEE P802.3bn once the approval order becomes more definitive.

Comment Type **TR** *Comment Status* **A** *Ref Model*

PMA_LINK.indication (link_status) is not shown connecting the PMA to the PCS in Figure 126-4 '2.5GBASE-T and 5GBASE-T service interfaces', is not listed in subclause 126.2.2 'PMA service interface', and is not used in the PCS state diagram on referenced in the PCS related text.

SuggestedRemedy

Suggest that:

[1] Remove the 'link_status' signal from the connection above the 'LINK MONITOR' block to the 'PCS TRANSMIT & TRANSMIT CONTROL' block in figure 126-3 'Function block diagram'.
[2] Remove the 'link_status' signal from figure 126-5 'PCS reference diagram'.
[3] Remove the 'link_status' signal from the connection above the 'LINK MONITOR' block to the 'PMA SERVICE INTERFACE' in figure 126-19 'PMA reference diagram'.
[4] Update the variable definition for 'link_status' in subclause 126.4.5.1 'State diagram variables' to read 'The link_status parameter set by PMA Link Monitor state diagram and communicated through the PMA_LINK.indicate primitive.'.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Align with resolution of similar comment in BQ (#110) (ACCEPT IN PRINCIPLE - This is apparently correct - PHY implementors should check whether there are any uses of link_status within the PCS that should be documented in the standard.
The same issue exists in Clause 55, commenter may wish to file a maintenance request.)

Cl **126** *SC* **126.1.3** *P* **79** *L* **29** # 114

Law, David — Hewlett Packard Enterp

Comment Type **T** *Comment Status* **A** *Ref Model*

The parameter 'scr_status' appears to only be used by the PMA Receive function (see subclause 126.4.2.4) and not by the PHY or Link control functions. In contrast the parameter 'pcs_status' appears to be used by the PHY and Link control functions (see Figure 126-26 and 126-27) and not by the PMA Receive function. Based on this, combining these two parameters on to a single line that connects to the PMA Receive, Link control, and PHY control functions doesn't seem to be the cleanest approach.

SuggestedRemedy

Suggest that:

[1] In Figure 126-3 separate lines be drawn from the PCS RECEIVE block (1) for 'scr_status' connecting to the PMA RECEIVE block, and (2) for 'pcs_status' connecting to both the LINK MONITOR and PHY CONTROL blocks.
[2] In Figure 126-5 separate lines be drawn from the PCS RECEIVE block for 'scr_status' and 'pcs_status' to the PMA service interface.
[3] In Figure 129-19 separate lines be drawn from the PMA service interface (1) for 'scr_status' connecting to the PMA RECEIVE block, and (2) for 'pcs_status' connecting to both the LINK MONITOR and PHY CONTROL blocks.

Law, David — Hewlett Packard Enterp

Comment Type **E** *Comment Status* **R** *State diagrams*

This paragraph states '... the transmit channel is in normal mode ...' however 'normal mode' is not described until five paragraph below where it is stated 'In the normal mode of operation, the PMA_TXMODE.indication message has the value SEND_N ...'. In addition, it seems some of this text in this paragraph is duplicative of the text five paragraphs below. For example it states '... the PCS Transmit process then scramble the bits of the 65B blocks ...', five paragraphs below it states '... During transmission, the 65B bits are scrambled by the PCS using a PCS scrambler ...'.

Note: I have submitted another comment on this paragraph in respect to the need to include a 'shall' statement.

SuggestedRemedy

Suggest that paragraph four be deleted, with some of its content combined in to the ninth paragraph. The ninth paragraph would then read 'If a PMA_TXMODE.indication message has the value SEND_N, the PCS is in the normal mode of operation, and the PCS Transmit process shall continuously generates 65B blocks based upon the TXD <31:0> and TXC <3:0> signals on the XGMII. The subsequent functions of the PCS Transmit process then scramble the bits of the 65B blocks, pack the resulting scrambled blocks, prepends and auxiliary bit, and appends 97 zeros, all of which are then processed by a low density parity check (LDPC) encoder. The appended zeros are then replaced by vendor discretionary randomized bits and joint mapped into a transmit LDPC frame of PAM16 symbols. Transmit data-units are sent to the PMA service interface via the PMA_UNITDATA.request primitive.

Response *Response Status* **C**

REJECT.

Comment Type **T** *Comment Status* **A** *State diagrams*

While this subclause states that the PCS transmit function shall meet the PCS state diagram (Figures 126-14 and 126-15) and bit ordering (Figure 126-6) I don't believe that either of these address the operation of what appears to be a three way multiplexor controlled by the PMA_TXMODE.indication parameter tx_mode which selects between training (SEND_T), normal (SEND_N) and sending zeros (SEND_Z). There does appear to be a description of this in paragraphs six, seven and nine of this subclause, however they do not contain 'shall' statements, nor does it appear there are any related shall statements elsewhere. Based on this there doesn't appear to be any 'shall' statements in relation to the control of the parameter tx_mode.

SuggestedRemedy

Suggest that:

[1] The text '... has the value SEND_Z, PCS Transmit passes a vector of zeros ...' be change to read '... has the value SEND_Z, PCS Transmit shall pass a vector of zeros ...'.
[2] The text '... has the value SEND_T, PCS Transmit generates sequences ...' be changed to read '... has the value SEND_T, PCS Transmit shall generate sequences ...'.
[3] The text 'In the normal mode of operation, the PMA_TXMODE.indication message has the value SEND_N, and the PCS Transmit function uses a ...' to read 'If a PMA_TXMODE.indication message has the value SEND_N, the PCS is in the normal mode of operation, and the PCS Transmit function shall use a

Law, David — Hewlett Packard Enterp

Comment Type **E** *Comment Status* **A** *Editorial*

This subclause states that 'Note that these figures show the mapping from XGMII to 64B/65B block for a block containing eight data characters.' however the figure itself doesn't provide this note. Suggest it would be better to provide the note in respect to the figure on the figure itself.

SuggestedRemedy

Suggest that the note 'Note that this figure shows the mapping from XGMII to 64B/65B block for a block containing eight data characters.' be move to, or added to, Figure 126-6. A similar note should also be added to Figure 126-7. If not the text in the existing text 'Note that these figures show ...' should be changed to read 'Note that the figure shows ...' as there is only one figure.

Subclause 126.3.2.3 'PCS Receive function' states that '... the auxiliary bit and the trailing zero-fill bits are stripped; and the 64B/65B ordered sets are converted to 64-bit data blocks to obtain the signals RXD<31:0> and RXC<3:0> for transmission to the XGMII.'.

Isn't this description missing the descrambling stage that has to occur after the auxiliary bit and the trailing zero-fill bits are stripped (see Figure 126-7) and aren't these '64B/65B blocks' rather than '64B/65B ordered sets'. In addition suggest this this text should mention that the 64B/65B mapping to the XGMII is performed by the PCS 64B/65B Receive state diagrams by decoding the output of the scrambler, rx_coded<64:0>.

SuggestedRemedy

Suggest the text '... with error correction; the auxiliary bit and the trailing zero-fill bits are stripped; and the 64B/65B ordered sets are converted to 64-bit data blocks to obtain the signals RXD<31:0> and RXC<3:0> for transmission to the XGMII.' be changed to read '... with error correction; the auxiliary bit and the trailing zero-fill bits are then stripped; descrambling is then performed. This process generates the 64B/65B block vector rx_coded<64:0> which is then decoded to form the XGMII signals RXD<31:0> and RXC<3:0> as specified in the PCS 64B/65B Receive state diagram (see Figure 126–16 and 126-17).'.

Comment Type **T** *Comment Status* **D** *State diagrams*

It appears the PCS 64B/65B Transmit state diagram is not controlled by the state of the PMA PHY Control State Diagram when EEE is not implemented. In this case, as stated in the definition for the pcs_data_mode variable in subclause 126.4.5.1, the 'PHY operates as if the value of this variable is TRUE'. Hence once 'pcs_reset = false' and the PHY enterers training, the MAC could send a packet (it does not take account of link_status) causing the PCS 64B/65B Transmit state diagram to start encoding the packet on to tx_coded even though the PHY is in training mode. This could then result in the transition from the tx_mode = SEND_T to SEND_N occurring mid packet resulting in the transmission of a truncated frame and an error at the receiver. Similarly when EEE is implemented, pcs_data_mode = true could occur mid packet with similar results.

SuggestedRemedy

Suggest that:

[1] A new 'TX_RESET' state be added to Figure 126–14 that is entered on open arrows of 'pcs_reset + !pcs_data_mode', sets 'tx_coded <= LBLOCK_T', and exited on 'T_TYPE(tx_raw) = C + LII' to the 'TX_INIT' state. This ensures reset is only exited during idle.
[2] The new 'TX_RESET' state is also entered until tx_mode = SEND_N using a suitable variable.

Proposed Response *Response Status* **Z**

REJECT.

Delete the subclause 126.3.6.3 'Messages', a subclause 126.3.6.2 'State diagram parameters' since for the following reasons there are not related to the state diagram.

[1] The message 'PMA_UNITDATA.indication' and the parameter 'rx_symb_vector' are not referenced in the PCS state diagrams.
The input to Figures 126-16 and 126-17 'PCS 64B/65B Receive state diagram' are 'rx_coded' which is the 'Input to decode function 65B block' in Figure 126-7 'PCS Receive bit ordering'. As can be seen in that figure, there are a number of processes that have already been performed on the parameter 'rx_symb_vector' from the message 'PMA_UNITDATA.request' before 'rx_coded' is presented as the input to the PCS state diagram.
[2] The message 'PMA_UNITDATA.request' and the parameter 'tx_symb_vector' are not referenced in the PCS state diagrams. The output of Figures 126-14 and 126-15 'PCS 64B/65B Transmit state diagram' are 'tx_coded' which is the 'Output of encoder function 65B block' in Figure 126-6 'PCS transmit bit ordering'. As can be seen in that figure, there are a number of processes that have to be performed before the parameter 'tx_symb_vector' for the message 'PMA_UNITDATA.request' is generated.
[3] 'PCS_status' is not a message, but instead a parameter of a message, regardless it is not generated or used by the by the PCS state diagrams.

SuggestedRemedy

Delete the subclause 126.3.6.3 'Messages'.

Comment Type **T** *Comment Status* **A** *EZ*

There seem to be three different formats used for when comparing T_TYPE(tx_raw) to a set of possible values On line 8 there is the example where the options are in brackets: 'T_TYPE(tx_raw) = (E + D + LI +T)'; on line 10 there is an example where they are not: 'T_TYPE(tx_raw) = C + LII'; and on line 16 the brackets are around the whole equation: 'T(T_TYPE(tx_raw) = C+LII)'. Suggest that the first example, where the options are listed in brackets where there is more than one, be used. And strictly speaking shouldn't these actually use the 'Indicates membership' character '?' rather than the '=' character. If so the first example 'T_TYPE(tx_raw) = (E + D + LI +T)' would read 'T_TYPE(tx_raw) ? {E, D, LI, T}'.

SuggestedRemedy

Please use a consistent format when comparing T_TYPE(tx_raw) and R_TYPE(rx_coded) to a set of possible values.

In "126.5.4.1 Receiver differential input signals" it says "800 octet frames with minimum IPG or greater than 799 octet IPG."

Looks like there is a missing word or two (carried over from 10GBASE-T). Doesn't make sense when I read this, should this say something like "(Frame size + IPG)> 812"?

Same text shows up in "126.5.4.4 Alien crosstalk noise rejection"

SuggestedRemedy

validate intent, and fix text.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE. Insert Editor's note (to be removed prior to Working Group ballot) - See estes_3bz_01_1115.pdf for derivation and rationale of the frame error ratio test.

Change "800 octet frames with minimum IPG or greater than 799 octet IPG." to read "800 octet frames with minimum IPG or greater than 220 octet IPG."
and change frame error ratio from 9.6x10^–9 to 7.8x10^-9.

Make same change in 126.5.4.4 P160 L35 (repeating editor's note).

Cl **126** *SC* **126.5.4.3** *P* **160** *L* **20** # 54

Cibula, Peter — Intel Corporation

Comment Type **T** *Comment Status* **A** *Clamp*

The text referring to the impairment signal power in 126.5.4.3 defines a maximum limit by stating that the calibrated power "...does not exceed 6 dBm..." The calibration procedure outlined in Annes 113A, 113A.3 Cable clamp validation uses a nominal value and a tolerance of +/- 10%.

Given that the calibration procedure permits a maximum value of 6.6dBm for the power level defined in Clause 126, the normative text should identify a nominal value with tolerance instead of a maximum value.

Note that the suggested remedy, which explicitly identifies the impairment signal power as a nominal level with a tolerance, is better aligned with Clause 40, which defines a signal level in the normative text (40.6.1.3.3) and a tolerance about this level in the informative annex (Annex 40B).

Note that the final form of the suggested remedy should align with the parallel requirment in Clause 113.5.4.3.

SuggestedRemedy

Change the text in 126.5.4.3, Page 160, Lines 19 and 20 from

"A sine wave with the amplitude held constant over the whole frequency range from 80 MHz to 1000 MHz, with the amplitude calibrated so that the signal power measured at the output of the clamp does not exceed 6 dBm, is used to generate the external electromagnetic field and corresponding shield current."

to

"A sine wave with the amplitude held constant over the whole frequency range from 80 MHz to 1000 MHz, with the amplitude calibrated to a nominal signal power of 6 dBm measured at the output of the clamp, is used to generate the external electromagnetic field and corresponding shield current."

and add a footnote to 126.5.4.3 stating

"The 6dBm nominal measured power may vary by +/-10% across frequency as discussed in Annex 113A."

There are factors of 4 in equations 126-10, 126-11, 126-21, 126-22, 126-24, 126-25, which corresponds to the number of connectors throughout the channel.

There are also factors of 2 in equations 126-14, 126-15, 126-16, 126-17 which corrspond to the number of the near-end connectors.

It is not clear what these factors are.

SuggestedRemedy

It is very informative that the text high-lights that these factors are the number of connectors in the corresponding channels.

Response *Response Status* **C**

Comment Type **T** *Comment Status* **A** *Cabling*

In "126.7.2.3 Return loss" (and many similar clauses), the text says "shall meet the values determined Equation (xx-yy)."

SuggestedRemedy

for 126.7.2.3 it should say "shall meet the values determined using Equation (126–13) at all frequencies from 100 MHz to 250 MHz." because Equation (126–12) covers 0-100Mhz.

In many other cases, it should just be "shall meet the values determined using Equation (xxx-yyy)"

Please search for "values determined Equation" and correct all as required.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Suggest the editing instructions should be based on inserting the new values alphabetically to remove a dependence on which amendment is approved first, it should also note that the subclause is also being modified by IEEE P802.3bq, but only if IEEE P802.3bq is approved first.

SuggestedRemedy

Suggest that:

[1] Update the editing instructions to read 'Insert new rows for 25GigT and 40GigT into the first list in subclause 28.3.1 (as modified by IEEE Std 802.3bq-201X), in alphabetical order:'.
[2] Add an editors note be added that reads 'Editor's note (to be removed prior to publication) If, once the approval order of the various amendments becomes settled, IEEE P802.3bz is to be approved prior to IEEE P802.3bq the editing instructions should be updated to remove reference to IEEE P802.3bq.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Update the editing instructions to read 'Insert new rows for 2.5GigT and 5GigT into the first list in subclause 28.3.1 (as modified by IEEE Std 802.3bq-201X), in alphabetical order:'

Cl **28** *SC* **28.3.1** *P* **27** *L* **8** # 141

Law, David — Hewlett Packard Enterp

Comment Type **T** *Comment Status* **A** *EZ*

The change to subclause 28.3.1 'State diagram variables' states that '2.5GigT' represents that the 2.5GBASE-T therefore the variables link_control and link_status would be designated 'link_control_2.5GigT' and 'link_status_2.5GigT' respectively for 2.5GBASE-T. the note for Figure 126–29 'Link Monitor state diagram' however states that 'The variables link_control and link_status are designated as link_control_2p5GigT and link_status_2p5GigT, respectively for 2.5GBASE-T'. Suggest that '2p5GigT' be used consistently to represent 2.5GBASE-T and therefore change the seven instances of '2.5GigT' to read '2p5GigT'.

SuggestedRemedy

Suggest that:

[1] The text '... rows for 2.5GigT and ..' be changed to read '... rows for 2p5GigT and ...' (page 27, line 8).
[2] The text '2.5GigT;' be changed to read '2p5GigT;' (page 27, line 10).
[3] The text '... assert link_status_2.5GigT=FAIL for ...' be changed to read '... assert link_status_2p5GigT=FAIL for ...' (page 165, line 50).
[4] The text '... link_status_2.5GigT (2.5GBASE-T) or ...'. be changed to read '... link_status_2p5GigT (2.5GBASE-T) or ...' (page 166, line 36).
[5] The text '... detected, link_status_2.5GigT (2.5GBASE-T) or ...' be changed to read '... detected, link_status_2p5GigT (2.5GBASE-T) or ...' (page 166, line 41).

Comment Type **E** *Comment Status* **A** *BQ Align*

IEEE P802.3bq draft D2.3 is changing '10 Gb/s' to read 'MultiGBASE-T', it is not adding '40 Gb/s'. Based on this the change shown here deleting '10/40 Gb/s' is not correct. In addition a note should be added to delete this change if IEEE P802.3bq is approved prior to IEEE P802.3bz since IEEE P802.3bq is making the same change.

SuggestedRemedy

Suggest that:

[1] The strike out text '10/40 Gb/s' should be changed to read '10 Gb/s'.
[2] An editors note that reads 'Editor's note (to be removed prior to publication) This change is also being made in IEEE P802.3bq. If, once the approval order of the various amendments becomes settled, IEEE P802.3bq is to be approved prior to IEEE P802.3bz, this change should be deleted.

Jones, Peter — Cisco

Comment Type **E** *Comment Status* **A** *BQ Align*

In the text for "45.2.1.62.1 LP information valid (1.129.0)", it says "When read as a one, bit 1.129.0 indicates that the startup protocol defined in 113.4.2.5 has been completed,."

I'm not clear why this was changed from pointing to 55.4.2.5 to 113.4.2.5. It seems like the clause 55 text is still there, neither BQ or BZ have modified it. 3bz includes similar text in 126.4.2.5 which is not referred to.

Below there is text like "The 10GBASE-T startup negotiation process and all TX power backoff settings are defined in 55.4.2.5 and 55.4.5.1. The 40GBASE-T startup negotiation process and all TX power backoff set-tings are defined in 113.4.2.5 and 113.4.5.1. For 2.5GBASE-T and 5GBASE-T, startup negotiation process and all TX power backoff settings are defined in 126.4.2.5 and 126.4.5.1.".
Maybe a table of clause names(which are common) to clause numbers (vary per clause) for the MultiGBASE-T references in "45.2.1 PMA/PMD registers " would improve reability & consistency?

SuggestedRemedy

At least fix reference to clause 126.
Consider adding a table mapping the clause names to the various MultiGBASE-T clause numbers, and then use table xref wiht a clause name as the cross refence in clause 45.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Fix the reference to clause 126. Add reference to Clause 55 back in. Editor to consider the table, aligning with resolution of a similar comment on BQ, and think about the ROI of a table.

This change states that '... This bit is a reflection of the PCS_status variable defined in ... in 126.3.6.1 for 2.5GBASE-T and 5GBASE-T ...'. I can't find mention of PCS_status variable in subclause 126.3.6.1 'State diagram conventions', nor in 126.3.6.2.2 'Variables'. the nearest mention I could find was in subclause 126.3.6.3 'Messages' however this just states 'Indicates whether the PCS is in a fully operational state. (See 126.3.7.1.)'. Based on this suggest the reference should be to 126.3.7.1.

SuggestedRemedy

Suggest the text '... in 126.3.6.1 for 2.5GBASE-T and 5GBASE-T ...' be changed to read ... in 126.3.7.1 for 2.5GBASE-T and 5GBASE-T ...'.

In "46.6.3 PICS proforma Tables for Reconciliation Sublayer and 10 Gigabit Media Independent", Table "46.6.3.1 General" lists all 3 rates as Mandatory.

We must allow systems that don't support all of 2.5G/5G/10G. Need a "condition" PICS - is there any precedent?

SuggestedRemedy

Add G4 which says "Must support at least one of G1, G2, G3" as M, and then chance G1/G2/G3 to O.

46.5 XGMII electrical characteristics
Says:
"The electrical characteristics of the XGMII are specified such that the XGMII can be applied within a
variety of 10 Gb/s equipment types" but not 2.5G/5G

SuggestedRemedy

Add "2.5Gb/s, 5Gb/s"

Subclause 78.1 is also being modified by IEEE P802.3by, IEEE P802.3bp and IEEE P802.3bq.

SuggestedRemedy

Suggest that '... into Table 78-1 with ...' be changed to read '... into Table 78-1 (as modified by IEEE Std 802.3by-201X,
IEEE Std 802.3bq-201X and TBD) with ...'.

The mode convertion properties of the cable used in this test set-up are a predominant factor in meeting the limits of Table 113A-2. Minimum TCL values should be provided as an aid to the read
er, as the alternative can be a time consuming trial and error process.
[Appologies for not having time to work out the equation forms just yet. - TB]

SuggestedRemedy

Insert a note as follows:
Note - as the mode conversion properties of the cable used in this test are a predominant factor in meeting the voltage limits of Table 113A-2, maximum TCL values have been provided to aid the reader in selecting a cable of suitable performance. Cable TCL values should not exceed those shown.

Insert a column in table 113A-2, to the right of DM voltage, labeled TCL, with the following values:
20Log(CM/DM) [equation form TBD]
33.7 dB
20Log(CM/DM) [equation form TBD]
26.6 dB

Response *Response Status* **C**

REJECT.
The intent of the annex is to provide a general purpose test setup, including exploration of cabling properties. Specifying requirements for cabling beyond the link segment requirements of a referencing clause would be in conflict with this intent.

Commenter is referred to ad hoc preparing a tutorial, and suggested to provide detailed information on the subject for that tutorial.
