Comment Type **TR** *Comment Status* **R**

100G, 200G, 400G have a bit indicating when the PMA supports remote loopback Ability bit. This bit is missing from the 25GE extended ability register

SuggestedRemedy

Define bit 15 of the 25G extended ability register (1.19) to be:
1.19.15 25G PMA remote loopback
ability
1 = 25G PMA has the ability to perform a remote loopback function
0 = 25G PMA does not have the ability to perform a remote loopback function
RO

45.2.1.14b.aa 25G PMA remote loopback ability (1.19.15)
When read as a one, bit 1.19.15 indicates that the 25G PMA is able to perform the remote loopback function. When read as a zero, bit 1.19.15 indicates that the 25G PMA is not able to perform the remote loopback function. If a 25G PMA is able to perform the remote loopback function, then it is controlled using the PMA remote loopback bit 1.0.1 (see 45.2.1.1.4).

Response *Response Status* **C**

REJECT.

Out of scope. Also, IEEE Std 802.3by-2016 defines the 25G PMA remote loopback capability in bit 1.13.15 in the 40G/100G PMA/PMD extended ability register. See Clause 109 (Table 109-3).

Law, David HPE

Comment Type **T** *Comment Status* **A**

Rather than modify item c) of subclause 105.1.2 to add 25GBASE-T the published IEEE Std 802.3bq-2016 25GBASE-T standard adds a new item d) to the list that reads 'd) The MDI as specified in Clause 113 for 25GBASE-T uses a 4 lane data path.' (see IEEE Std 802.3bq-2016 page 69). I believe that this is because item c) lists the single-lane data path PHYs yet 25GBASE-T uses a 4 lane data path. The change to item c) in IEEE P802.3cc draft D2.1 however adds 25GBASE-T to the item c) list, as well as 25GBASE-LR, and 25GBASE-ER. I don't believe it is correct to add 25GBASE-T and this change should be removed.

SuggestedRemedy

Suggest that:

[1] The subclause 105.1.2 editing instructions text '... (as inserted by IEEE Std 802.3by-2016 and modified by IEEE Std 802.3bq- 2016) ...' be changed to read '... (as inserted by IEEE Std 802.3by-2016) ...'.
[2] The subclause 105.1.2 item c) change text be changed to read '... 25GBASE-KR-S, <S>or </S>in Clause 112 for 25GBASE-SR<U>, or in Clause 114 for 25GBASE-LR and 25GBASE-ER</U> uses a single-lane data path.

The signal detect limit for 25GBASE-ER (-25 dBm) is now too near the minimum average receive power (-21 dBm). There should be at least 6 dB, preferably 7 dB, between them.

SuggestedRemedy

Either, change the Average optical power at TP3 FAIL limit in Table 114-4 for ER from -25 to -27 dBm.
Or, change the Average launch power (min) in Table 114-6 for ER from -3 to -2.2, and change the Average optical power at TP3 FAIL limit in Table 114-4 for ER from -25 to -26 dBm. This does not make any difference to transmitters with more than 1.8 dB TDP or a DC extinction ratio less than 10, nor does it stop implementers making high extinction transmitters. To preserve the LR-ER interop, increase the LR Tx and Rx min average by 0.8 dB or tweak the max and min losses in Table 114-10.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Change TP3 FAIL limit to -26 dBm. See Comment #13 (proposal for 6.2dB minimum channel loss in LR/ER interop).

Dawe, Piers — Mellanox

Comment Type **T** *Comment Status* **R**

The 25GBASE-ER extinction ratio limit should be relaxed to allow low cost transmitters that operate over a wide temperature range. 10GBASE-ER has a 3 dB limit with the same receiver reflectance and worse TDP than 25GBASE-ER, so there is room to relax the extinction ratio. The APD receiver is protected by limits on max OMA, max average power and min IL, that means that the highest power in 0, 1 or average is not affected by this change.

SuggestedRemedy

Change 4 dB to 3.5 dB

Response *Response Status* **C**

REJECT.

No consensus for change.

Straw poll: Do you agree with the proposed reject of Comment 24?

Cl **114** *SC* **114.6.1** *P* **34** *L* **7** # 26

Dawe, Piers — Mellanox

Comment Type **TR** *Comment Status* **D**

The 25GBASE-LR extinction ratio limit should be relaxed to allow low cost transmitters that operate over a wide temperature range. The limit should be lower than 10GBASE-LR because the laser has to run faster. This can be done here because 25GBASE-LR has better receiver reflectance and TDP than 10GBASE-LR. The receiver is protected by limits on max OMA and max average power that mean that the highest power in 0, 1 or average is not affected by this change.

SuggestedRemedy

Change 3.5 dB to 3 dB

Proposed Response *Response Status* **W**

PROPOSED REJECT.

Restatement of Comment #63 against P802.3cc D2.0, which was rejected, rebutted, and recirculated . Rejected because there still remains no consensus for change.

Change "given in Table 114-12" to "given in Table 114-12 for the two link directions separately"

Response *Response Status* **C**

ACCEPT.

Cl **114** *SC* **114.11** *P* **40** *L* **27** # 13

Anslow, Pete Ciena

Comment Type **T** *Comment Status* **A**

The insertion loss requirements in Table 114-12 do not seem to be correct.
LR Tx to ER Rx
The LR transmitter has an average launch power of -7 dBm min and 2 dBm max
The ER receiver can receive an average power of -21 dBm min and -4 dBm max
This limits the LR Tx to ER Rx channel insertion loss to be between 14 dB and 6 dB
At max TDP, the LR transmitter has an OMA of -5 + 2.7 = -2.3 dBm min and 2.2 dBm max
For max TDP the ER receiver sensitivity OMA is -19 + 2.7 = -16.3 dBm and overloads at -4 dBm
This limits the LR Tx to ER Rx channel insertion loss to be between 14 dB and 6.2 dB. As this is the more stringent requirement, this sets the values for this direction.
ER Tx to LR Rx
The ER transmitter has an average launch power of -3 dBm min and 6 dBm max
The LR receiver can receive an average power of -13.3 dBm min and 2 dBm max
This limits the ER Tx to LR Rx channel insertion loss to be between 10.3 dB and 4 dB
At max TDP, the ER transmitter has an OMA of -1 + 2.7 = 1.7 dBm min and 6 dBm max
For max TDP the LR receiver sensitivity OMA is -11.3 + 2.7 = -8.6 dBm and overloads at 2.2 dBm
This limits the ER Tx to LR Rx channel insertion loss to be between 10.3 dB and 3.8 dB.
As the average power requirements are more stringent, they set the values for this direction.

SuggestedRemedy

For LR Tx to ER Rx change the min loss to 6.2 dB and the max loss to 14 dB.

For ER Tx to LR Rx change the max loss to 10.3 dB.
