

ERL and System Performance for 50GBASE-CR

Mike Dudek Cavium

Tao Hu Cavium

Presented at May 2018 Pittsburgh interim.

- **This presentation is related to comment r02-15, and also investigates the effect on system performance as measured by COM of changes in ERL parameters and specifications. It builds on work presented in dudek_3cd_01_0318.**
- **No cable S parameters are available on the web site for cables with ERL close to the specification limit so Cavium CA2 was created to see what the effect would be on system performance with hosts with different ERL. The creation method and more details of this cable and the others used in the analysis are given in the back-up.**
- **Various changes to the ERL parameters have been proposed by Mellitz in comment r02-21 which will effect the values of ERL. This presentation looks at the effect of these changes on ERL.**

Mellitz, Richard Samtec, Inc.

Comment Type **TR** *Comment Status* **X**

In http://www.ieee802.org/3/cd/public/adhoc/archive/mellitz_3cd_032118_adhoc-v2.pdf changes to Grr were suggest and new more meaningful values of beta_x and rho_x are required. This is a cross-clause comment with clause 137. See proposed changes.

Values for these were presented in http://www.ieee802.org/3/cd/public/adhoc/archive/mellitz_040418_3cd_adhoc-v2.pdf and subsequent meetings.

Presentation to review will be provided at the interim.

SuggestedRemedy

- In table 136-13 page 226 change beta x to 1.7 and rho_x to 0.3
- In table 136-15 page 232 change beta x tp 1.7 and rho_x to 0.25
- In table 137-5 page 249 change beta x to1.7 and rho_x to 0.32
- In table 137-7 page 253 change beta x to1.7 and rho_x to 0.18

Proposed Response *Response Status* **O**

Cable assembly: Effect of parameter changes on ERL

136.11.4 Cable assembly ERL

ERL of the cable assembly at TP1 and at TP4 are computed using the procedure in 93A.5 with the values in Table 136–17. Parameters that do not appear in Table 136–17 take values from Table 136–18. The value of T_{fx} is twice the delay associated with the cable assembly test fixture being used. N_{bx} is set to the value of N_b in Table 136–18.

Comment

In table 136-15 page 232 change beta x tp 1.7 and rho_x to 0.25

Table 136–17—Cable assembly ERL parameter values

Parameter	Symbol	Value	Units
Transition time associated with a pulse	T_r	0.0189	ns
Incremental available signal loss factor	β_x	10.7	GHz
Permitted reflection from a transmission line external to the device under test	ρ_x	0.44	—
Length of the reflection signal	N	1000	—

Cable assembly ERL at TP1 and at TP4 shall be greater than or equal to 11 dB.

Editor's note: The value of ERL is to be confirmed.

Cable ERL results and conclusions

	COM TX 12mm (dB)	COM TX 30mm (dB)	D3.2		D3.2 comments	
			ERL11 (dB)	ERL22 (dB)	ERL11 (dB)	ERL22 (dB)
TE	4.58	4.19	19.18	17.31	20.52	19.47
FCI	4.21	3.70	15.19	19.19	15.95	20.66
CAVIUM CA2	3.89	3.56	9.72	14.23	10.70	16.13

The Changes have increased the ERL values by between 0.76dB and 2.2dB. As there is technical justification for the parameter changes we recommend they are adopted and the ERL pass/fail criterion is set based on these changed parameters.

Host Tx and system performance

136.9.3.4 Transmitter effective return loss (ERL)

ERL of the transmitter at TP2 is computed using the procedure in 93A.5 with the values in Table 136–13. Parameters that do not appear in Table 136–13 take values from Table 136–18. The value of T_{fx} is twice the delay associated with the TP2 test fixture being used. N_{bx} is set to the value of N_b in Table 136–18.

Comment

In table 136-13 page 226 change beta x to 1.7 and rho_x to 0.3

Table 136–13—Transmitter and receiver ERL parameter values

Parameter	Symbol	Value	Units
Transition time associated with a pulse	T_r	0.0189	ns
Incremental available signal loss factor	β_x	10.7	GHz
Permitted reflection from a transmission line external to the device under test	ρ_x	0.44	—
Length of the reflection signal	N	300	—

Transmitter ERL at TP2 shall meet Equation (136–6).

$$ERL \geq 8 + 40 \log_{10} \left(\frac{v_f}{\max_k (p(k))} \right) \quad (\text{dB}) \quad (136-6)$$

Where

- v_f is the steady-state voltage, defined in 136.9.3.1.2
- $p(k)$ is the linear fit pulse at preset 1 (no equalization) (see 136.9.3.1.2)

COM vs. Adjusted Host ERL

COM vs. Host ERL (comment: rho=0.3 beta_x=1.7 N=300 Grr_limit=1)

COM vs. Host ERL

COM vs. adjusted Host ERL (comment: rho=0.3 beta_x=1.7 N=300 Grr_limit=1)

Conclusions on host Tx.

- **The proposed changes to the ERL parameters result in different ERL values (approximately 3dB lower). There are technical justifications for the changes and we recommend they are accepted but the ERL pass/fail limit needs to be adjusted.**
- **The short hosts provide good system performance on these cables and are a likely implementation. They should pass the Tx specification.**
- **The long host with the Cb capacitance at 0.3pF provides bad system performance on all these cables (and particularly CaviumCA2). It should fail the Tx specification.**
- **It has been proposed that the specification should be a single value of ERL, a single value of SNR_{Risi} or a combination of a single value of ERL plus a single value of SNR_{Risi} however no single values for these parameters exists that will not have false passes or false fails with these hosts.**

Proposal.

- **The new ERL parameters should be adopted.**
- **A specification of $ERL \geq 4dB - 40 * \text{Log}_{10}(P_{max}/V_f)$ should then be adopted.**
- **Note that it has been suggested that it is inconvenient having this combined specification as ERL is generally measured with a VNA and post processing and P_{max}/V_f is measured with an oscilloscope and post processing. With this specification however test engineering could choose to use fixed pass/fail values for the testing of their product depending on the product type with a choice of paired values. E.g.**
 - $P_{max}/V_f \geq 0.49$ $ERL \geq 16.4$
 - $P_{max}/V_f \geq 0.55$ $ERL \geq 14.4$
 - $P_{max}/V_f \geq 0.63$ $ERL \geq 12.0$

Host Rx

- **Degradations caused by reflections within the host Rx are present during the interference tolerance test therefore they have to be compensated by the receiver having better other performance. (e.g. can work with lower COM).**
- **The improved Rx performance required for reflections within the host Rx is somewhat similar to requiring higher P_{max}/V_f when the ERL is poorer.**
- **ERL is required to limit reflections from the host Rx that are re-reflected by the cable.**
- **A fixed ERL of 12dB (with the revised ERL parameters) is proposed for the Rx.**

Back-up

Cable creation.

Block diagram of cable assembly CaviumCA2

The raw cable model uses the transmission line model in Clause 93A with parameters provided by Rich Mellitz for a 26AWG cable.

Some information on Clause 137 Device

137.9.2.1 Transmitter ERL

ERL of the transmitter at TP0a is computed using the procedure in 93A.5 with the values in Table 137–5. Parameters that do not appear in Table 137–5 take values from Table 137–6. The value of T_{fx} is twice the delay from TP0 to TP0a. N_{bx} is set to the value of N_b in Table 137–6.

Comment

Table 137–5—Transmitter and receiver ERL parameter values

In table 137-5 page 249 change beta x to 1.7 and rho_x to 0.32

Parameter	Symbol	Value	Units
Transition time associated with a pulse	T_r	0.0189	ns
Incremental available signal loss factor	β_x	10.7	GHz
Permitted reflection from a transmission line external to the device under test	ρ_x	0.44	—
Length of the reflection signal	N	100	—

Transmitter ERL at TP0a shall be greater than or equal to 16.1 dB.

Investigation of the effect of package length on ERL and SNR_{isi}

- **The 30mm package is the standard COM model package.**
- **The values of the parameters in the transmission line model were modified to create a 40mm package with the same insertion loss.**
- **ERL and SNR_{isi} were measured for both packages.**

30mm and 40mm TX packages
