Comment Type E Comment Status A EZ

Format of the "NOTE-" paragraph is incorrect

*SuggestedRemedy*

Use the appropriate paragraph style for "NOTE-" paragraphs.  
Consider scrubbing through the whole draft, to make sure all clauses are aligned with this:  
e.g. 147.3.2.7 and c146, including the annexes are good candidates for such checks

Response Response Status C

ACCEPT.

Cl 147 SC 147.3.2. P 179 L 26 # i-2

Huszak, Gergely

Kone

Comment Type T Comment Status A PCS

The proper definition of STD is lacking.

*SuggestedRemedy*

Do the following 2 changes:  
- Insert new timer to the end of 147.3.2.7 with the following content and using the regular timer definition layout/formatting::

```
====
5B_symbol_timer
The 5B_symbol_timer shall be generated synchronously with PCS transmit clock TX_CLK.
Continuous timer: The condition 5B_symbol_timer_done becomes true upon timer
expiration.
Restart time: Immediately after expiration, timer restart resets the condition
5B_symbol_timer_done.
Duration: Five DME clock transitions (see Table 147-2).
```

====  
- Change the definition of STD in 147.3.2.5:

from:

```
====
Alias for 5B symbol timer done, synchronous to PCS TX clock.
```

====  
to:

```
====
Alias for 5B_symbol_timer_done.
====
```

Response Response Status C

ACCEPT IN PRINCIPLE.  
Accomodated by comment i-423. Response to comment i-423 is:  
ACCEPT IN PRINCIPLE.  
Multiple editorial changes are required in both the PCS Receive and PCS Transmit functions subclauses to address the lack of clarity pointed out by the commenter.

Editorial license to align other comments with the variable name changes in this comment response, and to re-alphabetize variable names in lists as necessary.

Throughout the whole subclause 147.3.2 (including figures) apply the following changes:  
- replace all occurrences of "pcs\_txen" with "TX\_EN"  
- replace all occurrences of "pcs\_txer" with "TX\_ER"  
- replace all occurrences of "pcs\_txd" with "TXD"

Throughout the whole subclause 147.3.3 (including figures) apply the following changes:  
- replace all occurrences of "pcs\_rxdv" with "RX\_DV"  
- replace all occurrences of "pcs\_rxer" with "RX\_ER"  
- replace all occurrences of "pcs\_rxd" with "RXD"

## and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

At page 170, line 42 replace "with every PCS transmit clock cycle" to "with every symb\_timer expiration. The symb\_timer is defined in 147.3.2.7."

At page 177, line 33 change the description of the "tx\_sym" variable to: "5B symbol to be conveyed to the PMA Transmit function by the means of the PMA\_UNITDATA.request primitive specified in 147.2.2."

At page 178, line 24 change the description of the "ENCODE" function to: "This function takes a 4 bit input parameter Scn<3:0> and returns a 5B symbol according to the following procedure:

1. Convert Scn<3:0> into Sdn<3:0> as specified in 147.3.2.6.
2. Convert Sdn<3:0> (4B symbol) into the corresponding 5B symbol defined in Table 147-1."

At page 179, line 24 change the description of the "STD" abbreviation to: "Alias for symbol timer done."

At page 179, line 32, change the second paragraph (starting with "An implementation of ..." to read:

"An implementation of a self-synchronizing scrambler by a linear-feedback shift register is shown in Figure 147-6. The bits stored in the shift register delay line at time n are denoted by Scn<16:0>. The '+' symbol denotes the exclusive OR logical operation. When Scn<3:0> is presented at the input of the scrambler, Sdn<3:0> is produced by shifting in each bit of Scn<3:0> as Scn<i>, with i ranging from 0 to 3 (i.e., LSB first). The scrambler is reset upon execution of the PCS Reset function. If the PCS Reset is executed, all bits of the 17-bit vector representing the self-synchronizing scrambler state are arbitrarily set. The initialization of the scrambler state is left to the implementer. In no case shall the scrambler state be initialized to all zeroes. At every STD, if no data is presented at the scrambler input via Scn<3:0>, the scrambler may be fed with arbitrary inputs."

At page 180, line 8, append the following text to subclause 147.3.2.7:

"symb\_timer

A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the PCS concurrently with symb\_timer\_done (see 147.2.2). TX\_CLK (see 22.2.2.1) shall be generated from 5B\_symb\_timer with the rising edge of TX\_TCLK generated synchronously with 5B\_symb\_timer\_done.

Continuous timer: The condition symb\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration.

Duration: 400 ns ± 100 ppm (see 22.2.2.1)"

At page 179 in Figure 147-6 perform the following changes:

- replace "TXDn[i]" with "Scn<i>". Please note the 'n' is a subscript
- replace all square brackets '[']' with angular brackets '<>'

At page 180, line 9, change the description of the "RXn" variable to read:

"The rx\_sym parameter of the PMA\_UNITADATA.indication primitive defined in 147.2.1.

The 'n' subscript denotes the rx\_sym conveyed in the most recent recv\_symb\_conv\_timer cycle.

The 'n-x' subscript indicates the rx\_sym conveyed 'x' cycles behind the most recent one."

At page 181, line 18, change the description of the "DECODE" function to read: "This function takes a 5B symbol input parameter and returns a 4 bit value Dcn<3:0> value according to the following procedure:

1. Convert the 5B input symbol into Drn<3:0> by performing a reverse lookup of Table 147-1. If no 4B value is associated to the given 5B symbol, the PCS Receive function shall assert RX\_ER for at least one symbol period and Drn<3:0> may be set arbitrarily.
2. Convert Drn<3:0> to Dcn<3:0> as specified in 147.3.3.7."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

At page 181, line 26, change the description of the "RSCD" abbreviation to read: "Alias for recv\_symb\_conv\_timer\_done."

At page 183, line 48, insert a new subclause 147.3.3.x with name "Timers" between existing subclauses 147.3.3.7 and 147.3.3.8.

Add the following text to the newly created subclause:

"recv\_symb\_conv\_timer

A continuous timer which expires when the PMA\_UNITDATA.indication message is generated (see 147.2.1).

Continuous timer: The condition recv\_symb\_conv\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration.

Duration: timed by the PMA\_UNITDATA.indication message generation."

Perform renumbering of the subclauses accordingly.

At page 183, line 28 change the whole paragraph starting with "The PCS receive function shall ..." to read:

"The PCS Receive function descrambles the 5B/4B decoded data stream and returns the value of RXD<3:0> to the MII. The descrambler shall employ the polynomial defined in 147.3.2.6. The implementation of the self-synchronizing descrambler by linear-feedback shift register is shown in Figure 147-9. The bits stored in the shift register delay line at time n are denoted by Dcn<16:0>. The '+' symbol denotes the exclusive OR logical operation. When Drn<3:0> is presented at the input of the descrambler, Dcn<3:0> is produced by shifting in each bit of Drn<3:0> as Drn<i>, with i ranging from 0 to 3 (i.e., LSB first). The descrambler is reset upon execution of the PCS Reset function. If PCS Reset is executed, all the bits of the 17-bit vector representing the self-synchronizing descrambler state are arbitrarily set. The initialization of the descrambler state is left to the implementer. At every RSCD, if no data is presented at the descrambler input via Drn<3:0>, the descrambler may be fed with arbitrary inputs."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

At page 183, in figure 147-9, perform the following changes:

- replace "RXDn[i]" with "DCn[i]"
- replace all square brackets '[']' with angular brackets '<>'

At page 191, line 52, add the following text after "DME encoded stream received at the MDI.":

and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

"The clock recovery provides a synchronous clock for sampling the signal on the pair. While it may not drive the MII directly, the clock recovery function is the underlying source of RX\_CLK."

Cl 147 SC 147.3.3.5 P 181 L 26 # i-3

Huszak, Gergely Kone

Comment Type T Comment Status A PCS

The proper definition of RSCD is lacking.

SuggestedRemedy

Do the following 2 changes:
- Create a new subclause "147.3.3.8 Timers" (let 147.3.3.8-10 renumber automatically) and insert the following text underneath using the regular timer definition layout/formatting:

====
receive\_symbol\_conversion\_timer
The receive\_symbol\_conversion\_timer shall be generated synchronously with the PCS receive clock.

Continuous timer: The condition receive\_symbol\_conversion\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration, timer restart resets the condition receive\_symbol\_conversion\_timer\_done.

Duration: Five receive DME clock transitions (see Table 147-2).

====
- Change the definition of RSCD in 147.3.3.5:

from:
====
Alias for Receive Symbol Conversion Done, synchronous to PCS RX clock.

====
to:
====
Alias for receive\_symbol\_conversion\_timer\_done.

Response Response Status C

ACCEPT IN PRINCIPLE.
Accomodated by comment i-423. Response to comment i-423 is:
ACCEPT IN PRINCIPLE.
Multiple editorial changes are required in both the PCS Receive and PCS Transmit functions subclauses to address the lack of clarity pointed out by the commenter.

Editorial license to align other comments with the variable name changes in this comment response, and to re-alphabetize variable names in lists as necessary.

Throughout the whole subclause 147.3.2 (including figures) apply the following changes:
- replace all occurrences of "pcs\_txen" with "TX\_EN"
- replace all occurrences of "pcs\_txer" with "TX\_ER"
- replace all occurrences of "pcs\_txd" with "TXD"

Throughout the whole subclause 147.3.3 (including figures) apply the following changes:
- replace all occurrences of "pcs\_rxdv" with "RX\_DV"
- replace all occurrences of "pcs\_rxer" with "RX\_ER"
- replace all occurrences of "pcs\_rxd" with "RXD"

## Ind Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

At page 170, line 42 replace "with every PCS transmit clock cycle" to  
"with every symb\_timer expiration. The symb\_timer is defined in 147.3.2.7."

At page 177, line 33 change the description of the "tx\_sym" variable to:  
"5B symbol to be conveyed to the PMA Transmit function by the means of the  
PMA\_UNITDATA.request primitive specified in 147.2.2."

At page 178, line 24 change the description of the "ENCODE" function to:  
"This function takes a 4 bit input parameter Scn<3:0> and returns a 5B symbol according  
to the following procedure:  
1. Convert Scn<3:0> into Sdn<3:0> as specified in 147.3.2.6.  
2. Convert Sdn<3:0> (4B symbol) into the corresponding 5B symbol defined in Table 147-  
1."

At page 179, line 24 change the description of the "STD" abbreviation to:  
"Alias for symbol timer done."

At page 179, line 32, change the second paragraph (starting with "An implementation of ..."  
to read:  
"An implementation of a self-synchronizing scrambler by a linear-feedback shift register is  
shown in Figure 147-6. The bits stored in the shift register delay line at time n are denoted  
by Scn<16:0>. The '+' symbol denotes the exclusive OR logical operation. When  
Scn<3:0> is presented at the input of the scrambler, Sdn<3:0> is produced by shifting in  
each bit of Scn<3:0> as Scn<i>, with i ranging from 0 to 3 (i.e., LSB first). The scrambler is  
reset upon execution of the PCS Reset function. If the PCS Reset is executed, all bits of  
the 17-bit vector representing the self-synchronizing scrambler state are arbitrarily set. The  
initialization of the scrambler state is left to the implementer. In no case shall the scrambler  
state be initialized to all zeroes. At every STD, if no data is presented at the scrambler  
input via Scn<3:0>, the scrambler may be fed with arbitrary inputs."

At page 180, line 8, append the following text to subclause 147.3.2.7:  
"symb\_timer  
A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the  
PCS concurrently with symb\_timer\_done (see 147.2.2). TX\_CLK (see 22.2.2.1) shall be  
generated from 5B\_symb\_timer with the rising edge of TX\_TCLK generated synchronously  
with 5B\_symb\_timer\_done.  
Continuous timer: The condition symb\_timer\_done becomes true upon timer expiration.  
Restart time: Immediately after expiration.  
Duration: 400 ns ± 100 ppm (see 22.2.2.1)"

At page 179 in Figure 147-6 perform the following changes:  
- replace "TXDn[i]" with "Scn<i>". Please note the 'n' is a subscript  
- replace all square brackets '[' with angular brackets '<>'

At page 180, line 9, change the description of the "RXn" variable to read:  
"The rx\_sym parameter of the PMA\_UNITADATA.indication primitive defined in 147.2.1.  
The 'n' subscript denotes the rx\_sym conveyed in the most recent recv\_symb\_conv\_timer  
cycle."

The 'n-x' subscript indicates the rx\_sym conveyed 'x' cycles behind the most recent one."

At page 181, line 18, change the description of the "DECODE" function to read:  
"This function takes a 5B symbol input parameter and returns a 4 bit value Dcn<3:0> value  
according to the following procedure:  
1. Convert the 5B input symbol into Drn<3:0> by performing a reverse lookup of Table 147-  
1. If no 4B value is associated to the given 5B symbol, the PCS Receive function shall  
assert RX\_ER for at least one symbol period and Drn<3:0> may be set arbitrarily.  
2. Convert Drn<3:0> to Dcn<3:0> as specified in 147.3.3.7."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

At page 181, line 26, change the description of the "RSCD" abbreviation to read:  
"Alias for recv\_symb\_conv\_timer\_done."

At page 183, line 48, insert a new subclause 147.3.3.x with name "Timers" between  
existing subclauses 147.3.3.7 and 147.3.3.8.  
Add the following text to the newly created subclause:  
"recv\_symb\_conv\_timer  
A continuous timer which expires when the PMA\_UNITDATA.indication message is  
generated (see 147.2.1).  
Continuous timer: The condition recv\_symb\_conv\_timer\_done becomes true upon timer  
expiration.  
Restart time: Immediately after expiration.  
Duration: timed by the PMA\_UNITDATA.indication message generation."

Perform renumbering of the subclauses accordingly.

At page 183, line 28 change the whole paragraph starting with "The PCS receive function  
shall ..." to read:  
"The PCS Receive function descrambles the 5B/4B decoded data stream and returns the  
value of RXD<3:0> to the MII. The descrambler shall employ the polynomial defined in  
147.3.2.6. The implementation of the self-synchronizing descrambler by linear-feedback  
shift register is shown in Figure 147-9. The bits stored in the shift register delay line at time  
n are denoted by Dcn<16:0>. The '+' symbol denotes the exclusive OR logical operation.  
When Drn<3:0> is presented at the input of the descrambler, Dcn<3:0> is produced by  
shifting in each bit of Drn<3:0> as Drn<i>, with i ranging from 0 to 3 (i.e., LSB first). The  
descrambler is reset upon execution of the PCS Reset function. If PCS Reset is executed,  
all the bits of the 17-bit vector representing the self-synchronizing descrambler state are  
arbitrarily set. The initialization of the descrambler state is left to the implementer. At every  
RSCD, if no data is presented at the descrambler input via Drn<3:0>, the descrambler may  
be fed with arbitrary inputs."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

 Robinson, Gary RETIRED/unemployed  
 Comment Type TR Comment Status R PLCA  
 This standard is well written for its intended purpose but I do not believe it belongs as an amendment to 802.3 series.  
 This standard does not conform to the layer 1, 2, or 3 rules as the rest of 802.3.  
 Physical Layer Collision Avoidance (PLCA) when combined with CSMA/CD (which remains as an error handling function) constitutes a new Media Access Control (MAC) function and as such belongs in the MAC sublayer, not in the Physical Sublayer. Where such a function is appropriately placed is a matter of architecture, not implementation per clause 1.1.3 of the standard.

I would be satisfied if it was moved out of 802.3 and into 802.n or another series all together.

As the original contributor of CSMA/CD, 802.3 I have argued this issue before and I am sure it is not the last time.

SuggestedRemedy

I would be satisfied if it was moved out of 802.3 and into 802.n or another series all together.

Response Response Status W  
 REJECT.

The CRG disagrees with the commenter. The specification of PLCA is appropriately placed in the physical layer and carries out the operations delegated to the physical layer in the 802.3 architecture, providing mapping of PLS primitives to signalling for the PHY, and aligning the MAC data with the needs of the PHY. Nodes implementing the PLCA RS are interoperable on the same mixing segment with nodes without the PLCA RS implemented or enabled. The functions are located in the physical layer according to the definitions in ISO 7894-1:1994, which states that the physical layer provides "functional and procedural means to activate, maintain, and de-activate physical-connections for bit transmission between data-link-entities." (7.7.2), and that "functions may be provided by the (N)-layer to enhance the facilities offered to, and the quality of service seen by the (N+1)-entities over those which are offered to the (N)-layer by the (N-1)-layer" (5.3.3.1.2). The PLCA RS conforms to the Physical layer service specifications in IEEE 802.3 by interfacing with the MAC at the existing PLS\_CARRIER, PLS\_DATA\_VALID, and PLS\_SIGNAL primitives and providing the information necessary for the local MAC sublayer entity to perform media access functions. (IEEE Std 802.3-2018 6.2.3). The augmentation of the physical layer is consistent with prior augmentation of these primitives in IEEE Std 802.3 over its lifetime, but particularly the last 20 years. For further information, please see [http://www.ieee802.org/3/cg/public/adhoc/brandt\\_020619\\_3cg\\_01a\\_adhoc.pdf](http://www.ieee802.org/3/cg/public/adhoc/brandt_020619_3cg_01a_adhoc.pdf)

"RSCD indicates a new symbol has been decoded and is available for processing in the state diagram."

Response Response Status W

ACCEPT IN PRINCIPLE.

Accommodated by comment i-423. Response to comment i-423 is:

ACCEPT IN PRINCIPLE.

Multiple editorial changes are required in both the PCS Receive and PCS Transmit functions subclauses to address the lack of clarity pointed out by the commenter.

Editorial license to align other comments with the variable name changes in this comment response, and to re-alphabetize variable names in lists as necessary.

Throughout the whole subclause 147.3.2 (including figures) apply the following changes:

- replace all occurrences of "pcs\_txen" with "TX\_EN"
- replace all occurrences of "pcs\_txer" with "TX\_ER"
- replace all occurrences of "pcs\_txd" with "TXD"

Throughout the whole subclause 147.3.3 (including figures) apply the following changes:

- replace all occurrences of "pcs\_rxdv" with "RX\_DV"
- replace all occurrences of "pcs\_rxer" with "RX\_ER"
- replace all occurrences of "pcs\_rxd" with "RXD"

At page 170, line 42 replace "with every PCS transmit clock cycle" to "with every symb\_timer expiration. The symb\_timer is defined in 147.3.2.7."

At page 177, line 33 change the description of the "tx\_sym" variable to: "5B symbol to be conveyed to the PMA Transmit function by the means of the PMA\_UNITDATA.request primitive specified in 147.2.2."

At page 178, line 24 change the description of the "ENCODE" function to: "This function takes a 4 bit input parameter Scn<3:0> and returns a 5B symbol according to the following procedure:  
1. Convert Scn<3:0> into Sdn<3:0> as specified in 147.3.2.6.  
2. Convert Sdn<3:0> (4B symbol) into the corresponding 5B symbol defined in Table 147-1."

At page 179, line 24 change the description of the "STD" abbreviation to: "Alias for symbol timer done."

At page 179, line 32, change the second paragraph (starting with "An implementation of ...")

to read:

"An implementation of a self-synchronizing scrambler by a linear-feedback shift register is shown in Figure 147-6. The bits stored in the shift register delay line at time n are denoted by Scrn<16:0>. The '+' symbol denotes the exclusive OR logical operation. When Scn<3:0> is presented at the input of the scrambler, Sdn<3:0> is produced by shifting in each bit of Scn<3:0> as Scn<i>, with i ranging from 0 to 3 (i.e., LSB first). The scrambler is reset upon execution of the PCS Reset function. If the PCS Reset is executed, all bits of the 17-bit vector representing the self-synchronizing scrambler state are arbitrarily set. The initialization of the scrambler state is left to the implementer. In no case shall the scrambler state be initialized to all zeroes. At every STD, if no data is presented at the scrambler input via Scn<3:0>, the scrambler may be fed with arbitrary inputs."

At page 180, line 8, append the following text to subclause 147.3.2.7:

"symb\_timer

A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the PCS concurrently with symb\_timer\_done (see 147.2.2). TX\_CLK (see 22.2.2.1) shall be generated from 5B\_symb\_timer with the rising edge of TX\_TCLK generated synchronously with 5B\_symb\_timer\_done.

Continuous timer: The condition symb\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration.

Duration: 400 ns ± 100 ppm (see 22.2.2.1)"

At page 179 in Figure 147-6 perform the following changes:

- replace "TXDn[i]" with "Scn<i>". Please note the 'n' is a subscript
- replace all square brackets '[]' with angular brackets '<>'

At page 180, line 9, change the description of the "RXn" variable to read:

"The rx\_sym parameter of the PMA\_UNITADATA.indication primitive defined in 147.2.1. The 'n' subscript denotes the rx\_sym conveyed in the most recent recv\_symb\_conv\_timer cycle.

The 'n-x' subscript indicates the rx\_sym conveyed 'x' cycles behind the most recent one."

At page 181, line 18, change the description of the "DECODE" function to read:

"This function takes a 5B symbol input parameter and returns a 4 bit value Dcn<3:0> value according to the following procedure:

1. Convert the 5B input symbol into Drn<3:0> by performing a reverse lookup of Table 147-1. If no 4B value is associated to the given 5B symbol, the PCS Receive function shall assert RX\_ER for at least one symbol period and Drn<3:0> may be set arbitrarily.
2. Convert Drn<3:0> to Dcn<3:0> as specified in 147.3.3.7."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

At page 181, line 26, change the description of the "RSCD" abbreviation to read:

"Alias for recv\_symb\_conv\_timer\_done."

At page 183, line 48, insert a new subclause 147.3.3.x with name "Timers" between existing subclauses 147.3.3.7 and 147.3.3.8.

Add the following text to the newly created subclause:

"recv\_symb\_conv\_timer

A continuous timer which expires when the PMA\_UNITDATA.indication message is

and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

generated (see 147.2.1).  
 Continuous timer: The condition recv\_symb\_conv\_timer\_done becomes true upon timer expiration.  
 Restart time: Immediately after expiration.  
 Duration: timed by the PMA\_UNITDATA.indication message generation."

Perform renumbering of the subclauses accordingly.

At page 183, line 28 change the whole paragraph starting with "The PCS receive function shall ..." to read:  
 "The PCS Receive function descrambles the 5B/4B decoded data stream and returns the value of RXD<3:0> to the MII. The descrambler shall employ the polynomial defined in 147.3.2.6. The implementation of the self-synchronizing descrambler by linear-feedback shift register is shown in Figure 147-9. The bits stored in the shift register delay line at time n are denoted by Dcrn<16:0>. The '+' symbol denotes the exclusive OR logical operation. When Drn<3:0> is presented at the input of the descrambler, Dcn<3:0> is produced by shifting in each bit of Drn<3:0> as Drn<i>, with i ranging from 0 to 3 (i.e., LSB first). The descrambler is reset upon execution of the PCS Reset function. If PCS Reset is executed, all the bits of the 17-bit vector representing the self-synchronizing descrambler state are arbitrarily set. The initialization of the descrambler state is left to the implementer. At every RSCD, if no data is presented at the descrambler input via Drn<3:0>, the descrambler may be fed with arbitrary inputs."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

At page 183, in figure 147-9, perform the following changes:  
 - replace "RXDn[i]" with "DCn[i]"  
 - replace all square brackets '[]' with angular brackets '<>'

At page 191, line 52, add the following text after "DME encoded stream received at the MDI.":  
 "The clock recovery provides a synchronous clock for sampling the signal on the pair. While it may not drive the MII directly, the clock recovery function is the underlying source of RX\_CLK."

Yseboodt, Lennart Signify

Comment Type T Comment Status R AutoNeg

"Two different Auto-Negotiation speeds are defined in this subclause. A PHY shall support at least one of these Auto-Negotiation speeds."  
 and  
 "If Auto-Negotiation is implemented, 1000BASE-T1, 100BASE-T1, and 10BASE-T1S PHYs shall support HSM and may optionally support LSM."

I assume that support for Autoneg is optional. If this is the case, then the first requirement will need a qualifier. As-is, every PHY is required to support at least on Autoneg speed.

*SuggestedRemedy*

Change first quoted snippet to:  
 "Two different Auto-Negotiation speeds are defined in this subclause. If Auto-Negotiation is implemented, a PHY shall support at least one of these Auto-Negotiation speeds."

Possibly you may want to change "a PHY" into something more specific, given that this paragraph deals only with 10SPE ?

Response Response Status C

REJECT.

While auto-negotiation is optional, when it is not implemented, Clause 98 compliance is not required at all. Hence a statement in clause 98 which says "when auto-negotiation is not implemented" is moot.

146.8.4:

"The wire pair of the MDI shall withstand without damage the application of positive voltages of up to 60 V dc with the source current limited to 2000 mA, under all operating conditions, for an indefinite period of time."

146.8.5:

"The wire pair of the MDI shall withstand without damage the application of short circuits of any wire to the other wire of the same pair or ground potential, as per Table 146-9, under all operating conditions, for an indefinite period of time."

- Why does 146.8.4 only cover positive voltages ?
- ... and 146.8.5 covers both polarities ?
- why is the subject of the sentence 'the wire pair of the MDI' when it should be the device itself ?

*SuggestedRemedy*

Change the quoted text in 146.8.4 to read:

"The device shall withstand without damage the application of any voltages between 0 V dc and 60 V dc with the source current limited to 2000 mA, applied across BI\_DA+ and BI\_DA-, in either polarity, under all operating conditions, for an indefinite period of time."

Response Response Status W

ACCEPT IN PRINCIPLE.

On page 155, line 34:

Replace, "The wire pair of the MDI shall withstand without damage the application of positive voltages of up to 60 V dc with the source current limited to 2000 mA, under all operating conditions, for an indefinite period of time."

with, "The DTE shall withstand without damage the application of any voltages between 0 V DC and 60 V DC with the source current limited to 2000 mA, applied across BI\_DA+ and BI\_DA-, in either polarity, under all operating conditions, for an indefinite period of time."

(Editor's note: Make sure the "-" in BI\_DA- is an en-dash)

Comment Type T Comment Status R Big Ticket Item MDI

The sentence 'Connectors meeting the requirements of IEC 63171-1 or IEC 61076-3-125 may be used as the mechanical interface to the balanced cabling.' gives the impression that the mechanical interfaces given are the ones that have to be used. The sentence above, however, indicates that others may be used as well. Therefore the intention of this comment is to clarify that, if other mechanical interfaces are used, they still have to meet requirements in accordance with IEC 63171.

SuggestedRemedy

Change the sentence 'Connectors meeting the requirements of IEC 63171-1 or IEC 61076-3-125 may be used as the mechanical interface to the balanced cabling.' to 'Connectors meeting the requirements of IEC 63171-1 or IEC 61076-3-125 and other connector types suitable for 1-pair applications meeting the requirements of IEC 63171 may be used as the mechanical interface to the balanced cabling.'

Response Response Status C

REJECT.

According to IEEE Standards style, 'may' can be replaced by 'is/are allowed'. The text "may be used" would therefore be understood as "are allowed to be used", which does not convey that these "have to be used" as the commenter suggests. Further, the additional text that the connectors meet IEC 63171 would levy new requirements on the MDI connector without justification.

Motion: Move to accept the response for comment i-46 as:

Comment Type TR Comment Status D PLCA\_SCOPE

The PLCA protocol is a MAC protocol. It is virtually identical to a token bus protocol (shared medium) I specified years ago. This clause violates 802.3 layering, and though considerable effort has been made to place this in the Reconciliation Sublayer, it doesn't change the fact that the functions are medium access control.

SuggestedRemedy

Delete Clause 148 and related text.

Proposed Response Response Status W

PROPOSED REJECT.

The CRG disagrees with the commenter that PLCA is a MAC protocol.

Several evidence has been provided, and a tutorial has been given, to prove that PLCA is in fact a normal physical layer function.

See [http://www.ieee802.org/3/cg/public/Jan2019/Tutorial\\_cg\\_0119\\_final.pdf](http://www.ieee802.org/3/cg/public/Jan2019/Tutorial_cg_0119_final.pdf)

The fundamental reason for PLCA to be a physical layer function is that it only works in conjunction with the CSMA/CD MAC specified in Clause 4 (without any modification to Clause 4 itself).

PLCA provides carrierSense and collision detection information to the MAC by the means of the existing PLS\_CARRIER.indication and PLS\_SIGNAL.indication primitives which is what the Reconciliation Sublayer (which is part of the physical layer) is supposed to accomplish.

The commenter's statement "it doesn't change the fact that the functions are medium access control" rightfully deserves an appropriate answer, which is more conceptual rather than purely technical.

The PLCA working principle is to detect collisions (concurrent transmission of multiple stations on a shared network segment) in a logical sense. As an example, 10BASE-2 and 10BASE-5 detect concurrent transmissions by checking the DC voltage level on the shared media, that is detecting the superposition of multiple (not decodable) signals on the line. PLCA detects the very same concurrent transmissions by aligning the data conveyed by the local MAC to the unique transmit opportunity of the node and checking for concurrent reception of a packet. In such a way the collision does not result in "corrupting" the signal on the media. That is, the packet currently being transmitted is not interrupted, thus yielding the advertised network performance enhancement.

This is also in line with the ISO/OSI principle by which a layer may enhance the service it provides to the upper layer.

See [http://www.ieee802.org/3/cg/public/adhoc/brandt\\_020619\\_3cg\\_01a\\_adhoc.pdf](http://www.ieee802.org/3/cg/public/adhoc/brandt_020619_3cg_01a_adhoc.pdf)

Moreover the commenter is unclear as PLCA + CSMA/CD is obviously not identical to 802.4 Token Bus, and it is unclear what specification the commenter is referring to. For example, PLCA does not define any handshake protocol between nodes, it does not

## Link Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

generate packets and there is no concept of arbitration of the media. Additionally, CSMA/CD nodes with PLCA enabled interoperate properly with non-PLCA enabled nodes on the same network segment (without yielding the advertised gain in performance in this case). That would not be possible if nodes with PLCA enabled were not, in fact, using the CSMA/CD MAC protocol. See [http://www.ieee802.org/3/cg/public/Sept2018/beruto\\_3cg\\_mixing\\_PLCA\\_with\\_non\\_PLCA\\_enabled\\_nodes\\_r1.2.pdf](http://www.ieee802.org/3/cg/public/Sept2018/beruto_3cg_mixing_PLCA_with_non_PLCA_enabled_nodes_r1.2.pdf).

Comment Type T Comment Status A State Diagram

Variable rx\_lpi\_active is not initialized within WAIT\_SCRAMBLER state of the PCS receive state diagram. This variable is provided to the PHY Control state machine and also to the PMA receive block. While for the PHY Control state machine, the minwait\_timer prevents misinterpreting this variable, not having this variable initialized may have, depending on the implementation, side effects in the PMA receive block, as this block accidentally may assume, that the PHY is currently in LOW POWER IDLE state and handle the signal receiving accordingly (e.g. setting the receiver accidentally into low power state).

SuggestedRemedy

Add "rx\_lpi\_active <= FALSE" at the end of the execution block of state WAIT\_SCRAMBLER.

Response Response Status C

ACCEPT.

The usage of the brackets in the conditional branches of Figure 146-16 is not consistent within the Figure itself and with other Clauses of 802.3cg.

SuggestedRemedy

Remove all "(" and ")" brackets within the conditional branches as they are not needed.

Response Response Status C

ACCEPT IN PRINCIPLE. Accommodated by comment i-83.

Response to Comment i-83 is:

Order of precedence of operators is not defined in IEEE Std 802.3, so brackets are used when there are multiple operations (see clause 145 IEEE Std 802.3bt-2019 which needed to define these).

Brackets provide clarity to the reader when evaluating combined actions.

Review of other diagrams in clause 146 suggests the following change needed:

P120 L10 (Figure 146-5) change left-hand exit from SEND IDLE to "STD \* (!tx\_enable\_mii)"

P128 L1 (Figure 146-8) change entry condition to WAIT\_SCRAMBLER to add parens around the compound term of the "or":

"pcs\_reset +  
 (!receiving) \*  
 [ (loc\_rcvr\_status = NOT\_OK) +  
 (link\_status = FAIL) +  
 (rcv\_jab\_detected) ] )"

P130 L21 (Figure 146-10) change left-hand exit condition of RECEIVE state to add parens around !receiving:

"(!receiving) +  
 (link\_status = FAIL)"

Editor to review other added clauses for consistency and revise accordingly to add brackets/parens where needed.

CI 146 SC 146.7.1.4 P 150 L 44 # i-112

Graber, Steffen Pepperl+Fuchs GmbH

Comment Type T Comment Status A Link Segment

Table 146-5 provides different TCL and ELTCTL values for E1 and E2. As the conducted immunity test has the same test levels for E1 and E2 the TCL values should also be the same. As the conducted immunity test levels are significantly higher than the disturbance by alien disturbers, there is no need to distinguish between 1.0 Vpp and 2.4 Vpp operating mode.

SuggestedRemedy

Remove table 146-5 and replace this table by a table with the following entries for the TCL values: first row: of 0.1 MHz <= f <= 10 MHz: for E1: >= 50 dB; for E2: >= 50 dB, second row: 10 MHz < f <= 20 MHz: for E1: >= 50 - 20 log10(f / 10) dB; for E2: >= 50 - 20 log10(f / 10) dB. Remove the specification of the ELTCTL values.

Response Response Status C

ACCEPT IN PRINCIPLE.

Remove table 146-5 and replace this table by a table with the following entries for the TCL values: first row: of 0.1 MHz <= f <= 10 MHz: for E1: >= 50 dB; for E2: >= 50 dB, second row: 10 MHz < f <= 20 MHz: for E1: >= 50 - 20 log10(f / 10) dB; for E2: >= 50 - 20 log10(f / 10) dB. Remove the specification of the ELTCTL values.

Grant editorial license to adjust text to accommodate removal of the ELTCTL values.

Change 146.7.1 to recognize UTP for 10BASE-T1L, change last sentence of first paragraph of 146.7.1 (P146 L50) as shown:  
The transmission characteristics for the 10BASE-T1L link segment are specified to support applications requiring long reach such as industrial and process control, for up to at least 1000 m. 10BASE-T1L link segments may be shielded or screened, consistent with the specification in 146.7.1.6 and 146.7.2 or unshielded consistent with the specifications in 146.7.1.6 and 146.7.1.4.

Change 146.8.2 MDI electrical specification (P155 L11)  
Change: The MDI connector mated with a specified single balanced-pair connector shall meet the electrical requirements specified in 146.7.  
To: The electrical requirements specified in 146.5.4 and 146.5.5 shall be met when the PHY is connected to the MDI connector mated with the specified plug connector.

Insert new subclause 146.8.4 MDI mode conversion loss, following 146.8.3 (P155 L13) and renumber subsequent subclauses as shown:  
146.8.4 MDI mode conversion loss  
Mode conversion LCL (Sdc11) or TCL (Scd11) of the PHY measured at the MDI shall meet the values determined using Equation (146-xx) at all frequencies from 0.1 MHz to 20 MHz.

$$\text{ConversionLoss}(f) \geq \begin{cases} 25 & \text{for } 0.1 \text{ MHz} \leq f \leq 10 \text{ MHz} \\ 25 - 20 \times \log_{10}(f/10) & \text{for } 10 \text{ MHz} < f \leq 20 \text{ MHz} \end{cases} \text{ dB}$$

where f is the frequency in MHz.

PICS:

Add new PICS item after MDI2 (P166 L9) and renumber subsequent PICS items  
MDI3 MDI mode conversion loss Shall meet Equation 146-xx M Yes []

Comment Type T Comment Status D PICS

Clause 146.11.4.4 requires mandatory ticking of most of the items (besides LMF2) for a PHY. The link segment Clause provides requirements for the link segment (which are in principle not testable by the PHY) and not for the PHY itself. The PHY needs to be designed to work in conjunction with the (worst-case) link segment definition, but not meet the link segment definition by itself.

SuggestedRemedy

Please add for each support field also a N/A [ ] option (so that ticking this N/A field is allowed for a PHY), as e.g. done in IEEE802.3bp or make otherwise clear, that the PHY itself does not need to fulfil the link segment spec itself, but only need to work with a link segment meeting the link segment specification with the BER specified for the PHY.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Add new row to table of Major Capabilities and Options (146.11.3) P159 L21:

Item: \*INS

Feature: Installation / cabling

Subclause: 146.7

Value/Comment: Items marked with INS include installation practices and cabling specifications not applicable to a PHY manufacturer.

Status: O

Support: Yes [ ] No [ ]

Change Status of items in 146.11.4.4 (Link Segment Characteristics) to INS:M (LMF2 becomes INS:O, RTDL:M)

Make similar changes to 147.12.3 and 147.12.4.6 and 147.12.4.7

ACCEPT IN PRINCIPLE.  
 Superseded by resolution of i-373.

Proposed resolution of comment i-373 is:  
 PROPOSED ACCEPT IN PRINCIPLE.

At page 223, line 23 replace  
 "tx\_cmd Command to be conveyed to the PHY via MII. When set to NONE, no special signaling shall be conveyed. When set to BEACON or COMMIT, respective commands shall be conveyed to MII as specified in 148.4.4.1.1 and 148.4.4.1.2.  
 Values: NONE, BEACON or COMMIT"

with:

"tx\_cmd Command for the PLCA DATA State Diagram to convey to the PHY via the MII.  
 Values: NONE, BEACON or COMMIT"

At page 225, line 36, replace "TX\_ER" with "plca\_txer".

Apply the following changes, in this order exactly:

1. In figure 148-4 replace all occurrences of "TX\_ER" with "plca\_txer".
2. In figure 148-4, in the NORMAL state, add "TX\_ER <= plca\_txer"
3. In figure 148-4, in the IDLE state, add "TX\_ER <= ENCODE\_TXER(tx\_cmd). Replace "TXD <= 0000" with "TXD <= ENCODE\_TXD(tx\_cmd)"
4. In figure 148-4, in the RECEIVE, PENDING and WAIT\_MAC states, add "TX\_ER <= ENCODE\_TXER(tx\_cmd). Add "TXD <= ENCODE\_TXD(tx\_cmd)"
5. In figure 148-4, in the HOLD, ABORT, TRANSMIT and FLUSH states, add "TX\_ER <= plca\_txer".
6. In figure 148-4, in the HOLD and ABORT states, add "TXD <= 0000".

At page 228, line 10, add:  
 "plca\_txer the conditions for generating plca\_txer are the same as defined in 22.2.1.6 and 22.2.2.5 for the TX\_ER MII signal. Values: TRUE or FALSE"

Replace content of subclause 148.4.6.3 with the following text:

"ENCODE\_TXER  
 This function takes as its argument the tx\_cmd variable defined in 148.4.5.2.  
 It returns TRUE if tx\_cmd is BEACON or COMMIT. Otherwise it returns the value of the plca\_txer variable, defined in 148.4.6.2

ENCODE\_TXD  
 This function takes as its argument the tx\_cmd variable defined in 148.4.5.2.  
 If tx\_cmd is BEACON, the return value is the TXD encoding defined in Table 22-1 for the BEACON request.  
 If tx\_cmd is COMMIT, the return value is the TXD encoding defined in Table 22-1 for the COMMIT request.  
 Otherwise, the return value is 0000.  
 "

Replace content of subclause 148.4.3.6 with the following text:  
 "Generation of TX\_ER shall comply with the PLCA Data State Diagram specified in 148.4.6.1"

Apply the following modifications to the PICS:  
 At page 232, line 39, replace "Specified in 22.2.1.6" with "Specified in "148.4.6.1"  
 At page 233, line 44, delete the CON3 line.

Comment Type T Comment Status D State Diagram

The definition of RSTCD is unclear. From the phrase "Receive Symbol Tripled Conversion Done". This appears to be a symbol timer for triplets of received symbols, similar to symb\_triplet\_timer in 146.3.3.1.3. The text only says it is synchronized with the PCS receive clock. Also, this timer is not explicitly started anywhere.

*SuggestedRemedy*

Change RSTCD to Received\_symbol\_triplet\_conversion\_timer. Insert after sentence ending "RX\_CLK." (new line, after line 25) "Continuous timer: The condition Received\_symbol\_triplet\_conversion\_timer\_done (RSTCD) becomes true upon timer expiration.  
Restart time: Immediately after expiration, timer restart resets the condition Received\_symbol\_triplet\_conversion\_timer\_done (RSTCD).  
Duration: Three symbol times (see 146.5.4.5)" Also, add new subclause 146.3.4.1.4 Abbreviations, with text: "RSTCD Received\_symbol\_conversion\_timer\_done."

Zimmerman, George ADI, APL Group, Aquantia, BMW, Cisco, Commscop

Comment Type T Comment Status A State Diagram

The term "FORCE mode" is not defined anywhere in this clause, nor in the base standard. The setting of MASTER and SLAVE roles is not a mode, it is a function. In clause 96 there is a similar specification in 96.4.4, and the text there can be re-used. Note that this information is repeated in 146.6.2 and in 146.6.3 so it may not be necessary here at all.

*SuggestedRemedy*

Replace the first paragraph of 146.4.4 with the following (taken from 96.4.4) "If the Auto-Negotiation process (Clause 98) is not implemented or not enabled, PMA\_CONFIG MASTER-SLAVE configuration is predetermined to be MASTER or SLAVE via management control during initialization or via default hardware setup."

Response Response Status C

ACCEPT.

Cl 146 SC 146.5.4.1 P 141 L 49 # i-166

Zimmerman, George ADI, APL Group, Aquantia, BMW, Cisco, Commscop

Comment Type E Comment Status A AutoNeg

The information about existence of two transmitter output voltage modes and the rules for selection between them using auto-negotiation appears here for the first time. This information is somewhat out of place in the transmitter electrical specification subclause. Note that the resolution rules are repeated in 146.6.4, but that subclause is about the management interface and should not discuss AN at all. The appropriate place for AN rules is in clause 98 where similar rules for master/slave configuration are described.

*SuggestedRemedy*

Add text about the two voltage modes in 146.1.2 where similar features like MASTER/SLAVE modes and AN are described, as a new 4th paragraph (P104 L43, after the paragraph on PAM3 mapping) "The 10BASE-T1L PHY may optionally support an increased transmit and receive capability, supporting 2.4 Vpp. See 146.5.4.1. Insert new subclause 98B.3.1 10BASE-T1L-specific bit assignments with text: "Configuration for 10BASE-T1L specific bits A23, A24, and A25 are specified in 146.6. Move the management interface information (2nd para (not note) of 146.5.4.1, P142 L4-7) to 146.6.4 (P146 L15) as a new first paragraph.

Response Response Status C

ACCEPT IN PRINCIPLE.

Add text about the two voltage modes in 146.1.2 where similar features like MASTER/SLAVE modes and AN are described, as a new 4th paragraph (P104 L43, after the paragraph on PAM3 mapping) "The 10BASE-T1L PHY may optionally support an increased transmit and receive capability, supporting 2.4 Vpp differential. See 146.5.4.1.

Insert new subclause 98B.3.1 10BASE-T1L-specific bit assignments with text: "Configuration for 10BASE-T1L specific bits A23, A24, and A25 are specified in 146.6."

Move the management interface information (2nd para (not note) of 146.5.4.1, P142 L4-7) to 146.6.4 (P146 L15) as a new first paragraph.

Zimmerman, George ADI, APL Group, Aquantia, BMW, Cisco, Commscop

Comment Type T Comment Status A PMA Electrical

"The BER is expected to be less than 10<sup>-9</sup>, and, to satisfy this specification, the frame loss..." an expectation is not a specification.

*SuggestedRemedy*

Change to "The BER shall be less than 10<sup>-9</sup>. This specification is satisfied when the frame loss..."

Response Response Status C

ACCEPT IN PRINCIPLE.

Change to "The BER shall be less than 10<sup>-9</sup>. This specification may be considered satisfied when the frame loss..."

Change PICS PMAE22 (Page 164 L43) to:

"BER < 10<sup>-9</sup> with an alien crosstalk noise of magnitude of -106 dBm/Hz and bandwidth of 10 MHz at the MDI."

CI 146 SC 146.7.1.1 P 147 L 37 # i-169

Zimmerman, George ADI, APL Group, Aquantia, BMW, Cisco, Commscop

Comment Type E Comment Status A Link Segment

"For PHYs in the 2.4 Vpp operation mode, the insertion loss of each 10BASE-T1L link segment shall meet..." The link segment is not a part of the PHY and does not know in what operation mode the PHY is. Similarly in P148 L26.

*SuggestedRemedy*

There should be two specifications for link segments, a high-loss link segment that is only supported when the link (both PHYs) is in 2.4 Vpp mode and a low-loss segment that is supported regardless of the mode.

Divide existing 146.7.1.1 into 2 subclauses: 146.7.1.1.1 Insertion loss for PHYs in the 2.4 Vpp operation mode (starts at P147 L36) and 146.7.1.1.2 Insertion loss supported for PHYs in 1.0 Vpp operation mode (starts at P148 L25, with "For PHYs in the 1.0..."). Add text to 146.7.1 "There are two link segment insertion loss specifications supported, depending on whether the 2.4 Vpp mode is supported and selected, as specified in 146.6.4. All 10BASE-T1L PHYs support the insertion loss specified in 146.7.1.2, but support of the insertion loss specified in 146.7.1.1 is only required when the 2.4 Vpp transmit/receive ability is operational."

Response Response Status C

ACCEPT IN PRINCIPLE.

Fix typo "abd" in commenters suggested remedy:

Divide existing 146.7.1.1 into 2 subclauses:

146.7.1.1.1 Insertion loss for PHYs in the 2.4 Vpp operation mode (starts at P147 L36) and 146.7.1.1.2 Insertion loss supported for PHYs in 1.0 Vpp operation mode (starts at P148 L25, with "For PHYs in the 1.0...").

Add text to 146.7.1 "There are two link segment insertion loss specifications supported, depending on whether the 2.4 Vpp mode is supported and selected, as specified in 146.6.4. All 10BASE-T1L PHYs support the insertion loss specified in 146.7.1.2, but support of the insertion loss specified in 146.7.1.1 is only required when the 2.4 Vpp transmit/receive ability is operational."

There is no definition of "COMMAND" state in PCS Transmit function.

SuggestedRemedy

Delete the sentence "5B symbol to be transmitted when the PCS Transmit function is in COMMAND state."

Response Response Status C

ACCEPT IN PRINCIPLE.  
RESOLVED BY COMMENT i-369, THE PROPOSED RESPONSE OF WHICH IS AS FOLLOWS:

>>>>  
PROPOSED ACCEPT IN PRINCIPLE.  
1. Change the definition of tx\_cmd to read:  
====  
tx\_cmd  
Encoding present on TXD<3:0>, TX\_ER, and TX\_EN as defined in Table 22-1.  
Values:  
BEACON: PLCA BEACON indication encoding present on TXD<3:0>, TX\_ER, and TX\_EN.  
COMMIT: PLCA COMMIT indication encoding present on TXD<3:0>, TX\_ER, and TX\_EN.  
SILENCE: TXD<3:0> does not encode any of the above requests, or TX\_ER = FALSE, or TX\_ER = TRUE.

====  
2. Add the following to 147.3.2.4 changing the title to 'Functions':  
====  
TXCMD\_ENCODE  
In the PCS transmit process, this function takes as its arguments the values of tx\_cmd and hb\_cmd variables and returns a 5B symbol based on the following mapping:  
'N' when the tx\_cmd variable is set to BEACON,  
'J' when the tx\_cmd variable is set to COMMIT,  
'T' when the hb\_cmd variable is set to HEARTBEAT and the tx\_cmd variable is not set to BEACON or COMMIT,  
'I' otherwise.

====  
3. Change the action 'tx\_sym <= tx\_cmd' in the SILENT state of Figure 147-4 'PCS Transmit state diagram' to read 'tx\_sym <= TXCMD\_ENCODE(tx\_cmd, hb\_cmd)'.

\*\*\* Comment submitted with the file 100619700003-fig\_148\_4.png attached \*\*\*

In figure 148-4 in the "RECEIVE" state box, CARRIER\_STATUS is set according to CRS and rx\_cmd. According to IEEE state diagram representation, such assignment is only evaluated once when first entering the RECEIVE state. This is not the intended behavior, the CARRIER\_STATUS parameter needs to be updated anytime the expression changes because of CRS or rx\_cmd.

SuggestedRemedy

Add a recirculating arc to the RECEIVE state with 'ELSE' as a condition. See also attached figure.

Beruto, Piergiorgio Canova Tech S.r.l.

Comment Type T Comment Status D PLCA

aPLCANodeCount has a default value of 255. This makes no sense at all since this attribute is used to set the maximum number of nodes that will get a transmit opportunity on the local collision domain, as specified in Clause 148. This is one of the parameters that have to be set prior to enable PLCA operations, as stated in 148.4.5.1.

On the other hand, aPLCALocalNodeID has no default value, which also makes no sense as value 255 is used to prevent PLCA from starting a cycle of transmit opportunities as shown in figure 148-3 in the transition from DISABLE to RESYNC state.

SuggestedRemedy

At line 12 change " The default value is 255.;" to " The default value is 0.;"  
At line 22 add " The default value is 255." after "This value is assigned to define the ID of the local node on the PLCA network."

Beruto, Piergiorgio Canova Tech S.r.l.

Comment Type T Comment Status A PLCA

The description of aPLCALocalNodeID specifies that the number must be in the range of 0 to aPLCANodeCount-1. However, in figure 148-3 the "local\_nodeID" variable, which maps to aPLCANodeCount, is checked in the transition from "DISABLE" to "RESYNC" against the value 255. Additionally, a node with local\_nodeID >= aPLCANodeCount would not be able to send a packet during a cycle of transmit opportunities but it could receive packets as normal. Since this is the desired behavior, it should not be disallowed by the valid range of aPLCALocalNodeID.

SuggestedRemedy

Replace "Value must be in the range of [0, aPLCANodeCount - 1] (inclusive).;" with "Valid range is 0 to 255, inclusive.;"

Response Response Status C

\*\*\* Comment submitted with the file 100622500003-Koczwara\_3cg\_PLCA\_improvement\_for\_high\_node\_count\_v1p6.pdf attached \*\*\*

Variable delay line in PLCA RS can overrun slotTime, resulting in late collisions. See Koczwara\_3cg\_PLCA\_improvement\_for\_high\_node\_count\_v1p6.pdf slides 4-8 for more detail.

*SuggestedRemedy*

Specify the delay in the PLCA RS to less than 496 bit times (to avoid late collisions) and use carrier-sense to avoid buffer overflow. See Koczwara\_3cg\_PLCA\_improvement\_for\_high\_node\_count\_v1p6.pdf slides 10-23 for detailed text and state diagram changes.

Response Response Status C

ACCEPT IN PRINCIPLE.  
Accommodated by i-425.

Resolution of comment i-425 is:

ACCEPT IN PRINCIPLE.

Change 148.4.6.1 page 225 In 33-34 from:

The variable delay line is a small buffer that aligns a transmission with the transmit opportunity. The variable delay line length is no greater than  $to\_timer * plca\_node\_count + beacon\_timer$ .

To:

The variable delay line is a small buffer that aligns a transmission with the transmit opportunity.

In Figure 148-4, page 226, In 49-50, in the transition from the HOLD state to the A connector, change the condition to:

"recv\_timer\_done + receiving + (a ≥ delay\_line\_length)"

In Figure 148-4, page 227, In 7-16 do the following:

1. remove the transition from the COLLIDE to the PENDING STATE and its associated condition
2. In Figure 148-4, add a new state DELAY\_PENDING between COLLIDE and PENDING states.
3. Add a transition between COLLIDE and DELAY\_PENDING states with the following condition: "!plca\_txen"
4. Add a transition between DELAY\_PENDING and PENDING states with the following condition: "pending\_timer\_done"
5. Add the following text inside the DELAY\_PENDING state box:  
"start pending\_timer  
SIGNAL\_STATUS <= NO\_SIGNAL\_ERROR"
6. From the PENDING state delete "CARRIER\_STATUS <= CARRIER\_ON" and "SIGNAL\_STATUS <= NO\_SIGNAL\_ERROR"

nd Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Grant editorial license to draw the diagram according to IEEE 802.3 style

Change in 148.4.6.1, page 225 In 43-46:

During the COLLIDE state, the PLCA Data state diagram asserts packetPending = FALSE and CARRIER\_STATUS = CARRIER\_ON via the PLS\_CARRIER.indication primitive. When the MAC is done sending the jam bits as described in Clause 4, it waits for the next transmit opportunity by switching to PENDING state.

To:

During the COLLIDE state, packetPending = FALSE and CARRIER\_STATUS = CARRIER\_ON are asserted via the PLS\_CARRIER.indication primitive. When the MAC is done sending the jam bits as described in Clause 4, it waits for the next transmit opportunity by switching to DELAY\_PENDING state. The PLCA Data State Diagram transitions to the PENDING state after waiting for the pending\_timer. The pending\_timer is used to prevent committing to a transmit opportunity before transmit data is available. This prevents conveying unwanted long COMMIT requests to the PHY.

Append text to 148.4.6.4 Timers, page 228 In 54:

pending\_timer

Defined the time the PLCA Data State Diagram waits in the DELAY\_PENDING state before switching to PENDING state.

Duration: 512 bit times.

add subclause 148.4.6.5 Constants, page 228 In 54:

delay\_line\_length

This constant is implementation dependent and specifies the maximum length of the PLCA RS variable delay line depicted in figure 148-2.

Value: up to 396 bit times

Change in 147.11 Delay constraints, page 205 line 44

Table 147-6—10BASE-T1S delay constraints

"MDI input to COL asserted Maximum value: 25.6us"

Comment Type E Comment Status A PLCA

There is no addition to the text of the last sentence for oPHYEntity to note its containment of your new oPLCA (Needed to be consistent with your view of the world. Not needed here for my view of the world.)

SuggestedRemedy

Add appropriate text to the last sentence of oPLCA.

Response Response Status C

ACCEPT IN PRINCIPLE.

At line 8 of page 34, insert new Editing Instruction, "Change the entry for oPHYEntity in 30.2.2.1 (as amended by IEEE Std 802.3bt-2018) as follows:"

Insert...

"oPHYEntity

If oOMPEmulation is implemented, oPHYEntity is contained within oOMPEmulation. If oMACMergeEntity is implemented, oPHYEntity is contained within oMACMergeEntity. Otherwise oPHYEntity is contained within oMACEntity. Many instances of oPHYEntity may coexist within one instance of oMACEntity or oMACMergeEntity; however, only one PHY may be active for data transfer to and from the MAC at any one time. oPHYEntity is the managed object that contains the MAU, PAF, PLCA, PSE, and PoDLPSE managed objects in a DTE."

Underline "PLCA, " to show change from amended IEEE Std 802.3bt-2018 text.

Cl 30 SC 30.3 P 37 L 31 # i-215

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status R PLCA

I believe that the BEHAVIOUR of each of the following MAC attributes may need additional text to describe how it behaves (differently) when used in a PLCA network: 30.3.1.1.3 aSingleCollisionFrames; 30.3.1.1.4 aMultipleCollisionFrames; 30.3.1.1.9 aFramesWithDeferredXmissions; 30.3.1.1.10 aLateCollisions; 30.3.1.1.20 aFramesWithExcessiveDeferral; 30.3.1.1.30 aCollisionFrames; 30.3.1.1.31 aMACCapabilities; 30.3.1.1.32 aDuplexStatus

SuggestedRemedy

Examine each BEHAVIOUR for each of the listed attributes in the context of PLCA operation and augment the text definition of each BEHAVIOUR to cover operation in PLCA mode. This should explicitly cover whether an occurrence is an error in PLCA operation when such is not the case in CSMA/CD.

Response Response Status U

REJECT.

The CRG disagrees with the commenter. PLCA does not to change the behavior of these attributes.

Cl 30 SC 30.3.9.1.1 P 38 L 15 # i-216

Thompson, Geoffrey Independent Consultant

Comment Type E Comment Status A PLCA

I feel that the "Behaviour" description could be improved.

SuggestedRemedy

Replace text with: A read-only value that indicates the mode of operation of the Reconciliation Sublayer for PLCA operation. When PLCA is enabled, the reconciliation sublayer functions in PLCA mode whose operation is defined by Clause 148. When PLCA functions are not supported or are disabled by the management interface (plca\_en = FALSE), RS operation shall conform to the MII RS definition in Clause 22. By default, PLCA is disabled.;

Response Response Status C

ACCEPT.

 Thompson, Geoffrey Independent Consultant  
 Comment Type E Comment Status R Registers  
 Add "normal operation" text to description to match the last clause of the the text above.  
 SuggestedRemedy  
 Change text "Disable loopback mode" to "Disable loopback mode, normal operation"  
 Response Response Status C  
 REJECT.  
 The CRG disagrees with the commenter. Text is consistent with all other existing "loopback mode" entries in IEEE Std 802.3. See, e.g., Table 45-4, bit 1.0.0.  
 Whether normal operation is, in fact, in order is subject to other controls. For example, test modes would prohibit normal operation, even though loopback was disabled.

nd Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Cl 45 SC 45.2.3.68c P 55 L 5 # i-225

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status R Registers

The text here says that "The default value for each bit of the ... control register should be chosen so that the initial state of the device upon power up or reset is a normal operational state without management intervention." It is not well placed or a requirement nor is it reflected in the table definitions.

SuggestedRemedy

There needs a) to be a "shall" statement b) so that there will be a corresponding entry in the PICS Pro Forma, c) placed so the text applies to the entire device below the MII and d) reflected with a default value declaration for each bit in each control register.

Response Response Status U

REJECT.

The CRG disagrees with the commenter. The statement is consistent in placement and wording with similar statement in similar control registers in Clause 45 of IEEE Std 802.3-2018. Like these registers, the 10BASE-T1S PCS control register controls test modes, and the statement is advisory. IEEE Std 802.3-2018 does not require this with a 'shall' statement, as the commenter suggests.

Cl 45 SC 45.2.3.68c.1 P 55 L 23 # i-226

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status R Registers

The text description here and its corresponding table entry are confusing. If (as described in the table) this bit is self-clearing (as described in the table) then the text should indicate that in the description and the penultimate sentence should be modified. If the bit is not self clearing then the SC should be removed from the table.

SuggestedRemedy

Modify text and table contents so that they are fully descriptive and consistent.

Response Response Status C

REJECT.

The CRG disagrees with the commenter. The text indicates that the bit is self-clearing at page 55, line 28, "This bit is self-clearing and the 10BASE-T1S PCS shall return a value of one in bit 3.2291.15 when a reset is in progress; otherwise, it shall return a value of zero."

Since the MDI connector that is called out is not required there is no standardized way or specifically characterized test point where specification or conformance testing can be done on a multi-vendor repeatable basis.

*SuggestedRemedy*

Add text that permits alternate connections/connectors can be used in the application environment, that the compliance requirements (like other Ethernet PHYs) are specified and tested at the mating surface of the specified MDI connector.

Proposed Response Response Status **Z**

REJECT.

This comment was WITHDRAWN by the commenter.

Cl 146 SC 146.8.4 P 155 L 33 # i-240

Thompson, Geoffrey Independent Consultant

Comment Type **TR** Comment Status **A** MDI

The phrasing of this clause and the next one make it appear that this is a requirement for testing the wiring rather than as a test access point for testing the DTE. Further, the test limit for a withstand voltage has absolutely zero margin with respect to PoDL which is contrary to usual practice for withstand voltage requirements. Additionally, consideration should be given to the possibility of there being other voltages in a sheath shared with this instance of 10BASE-T1L such as PoE.

*SuggestedRemedy*

Change the text to make it clearer that this test is a test of the DTE as tested from the MDI. Raise the test limit to be more appropriate with traditional withstand limits (ref e.g. cl. 14, 10BASE-T) and real world requirements such as static discharge.

Response Response Status **C**

ACCEPT IN PRINCIPLE.

Accommodated by i-42. The resolution to i-42 is:

Replace, "The wire pair of the MDI shall withstand without damage the application of positive voltages of up to 60 V dc with the source current limited to 2000 mA, under all operating conditions, for an indefinite period of time."

with, "The DTE shall withstand without damage the application of any voltages between 0 V DC and 60 V DC with the source current limited to 2000 mA, applied across BI\_DA+ and BI\_DA-, in either polarity, under all operating conditions, for an indefinite period of time."

(Editor's note: Make sure the "-" in BI\_DA- is an en-dash)

 Comment Type ER Comment Status D PMA Electrical  
 This clause and its sub-clauses don't say anything useful to specify the conformance requirements for 10BASE-T1S Physical Layer implementation. Saying something "may" be relevant also means it "may not" be relevant. It also means it is not an element of a conformance requirement.  
 SuggestedRemedy  
 Replace with: Applications for the specified device commonly have additional requirements that limit its conducted radio frequency emission and its susceptibility to electromagnetic interference coupling to the cabling system. Such requirements are beyond the scope of this standard.

Proposed Response Response Status W  
 PROPOSED REJECT.  
 The proposed change in the comment does not contain sufficient detail so that the CRG can understand the specific changes that satisfy the commenter. It is unclear exactly which part of the text the commenter wishes to replace. Replacing the entire subclause and its subclauses would remove useful information for the application of the physical layer devices specified in this clause.

Cl 147 SC 147.5.5.1 P 196 L 40 # i-255  
 Thompson, Geoffrey Independent Consultant  
 Comment Type ER Comment Status D PMA Electrical  
 "...and sent to the MII during normal..." Because of the inclusion PLCA as being within the scope of this project the term MII is ambiguous in the context of this draft as there are two reconciliation sublayers. This a result of the further confusion between the "PHY" and the "Physical Layer". Originally the RS was supposed to a functionally transparent block which only (a) did not interfere with access at all and (b) allowed the old physical interface (AU) to move to a more logical division point (MII) in line with the evolution of technology over the twenty years from 1973 to 1993.

SuggestedRemedy  
 Either define two terms, one for each RS (e.g. DMII, AMII) or clearly state which RS is intended in each use of MII in this project's draft.  
 Proposed Response Response Status W  
 PROPOSED REJECT.  
 Commenter is incorrect pointing out that the term MII is ambiguous in the context of this draft. The MII is the interface between the PHY and the RS, which both belong to the Physical Layer. In the context of C147 the MII is supposed to work with either C22 RS or Clause 148 RS (PLCA) seamlessly. C148 RS is specified to behave exactly as C22 RS when PLCA function is disabled.

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status D PMA Electrical

I don't understand how the following text can be true: "The PMA local loopback function is optional" ...on a PMA where transmit is connected to receive.

*SuggestedRemedy*

Please clarify. I think you mean "The PMA local loopback test function is optional."

Proposed Response Response Status W

PROPOSED REJECT.

The CRG disagrees with the commenter - text is clear - the PMA local loopback function is optional.

What this test mode does in

- half-duplex mode, is overriding part of the condition on the single-ended arrow that point into WAIT\_SYNC in "Figure 147-7-PCS Receive state diagram", allowing receiving back transmitting station's own data.

- full-duplex mode, is suspending functionality that would prevent the transmitting station from receiving its own data.

Cl 147 SC 147.5.6 P 197 L 24 # i-257

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status D PMA Electrical

The word "unterminated" here implies that loopback only works if there is no compliant link segment and other MAU connected but there is a requirement of some sort for some circuit characteristics at the MDI to guarantee the echo.

*SuggestedRemedy*

Clarify and specify

Proposed Response Response Status W

PROPOSED REJECT.

In full-duplex PMA loopback only works with unterminated link segment (If the line is terminated, then you don't get any signal back, the reflection coefficient is 0).

PMA loopback mode is meant for serving diagnostics purposes, used in a special mode, therefore collision is not a concern there.

Cl 147 SC 147.5.6 P 197 L 27 # i-258

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status D PMA Electrical

The paragraph seems to assume that what is on the receive PMA is sufficiently well-formed to be to be decoded and converted to data. Since it is the sum of two or more signals that is not a valid assumption.

*SuggestedRemedy*

Add the following text: "During a collision (i.e. either a transmit collision or a receive collision) no assumptions whatsoever can be made about the validity or decodability of the waveform present at the input of the receiver."

Proposed Response Response Status W

PROPOSED REJECT.

Commenter is incorrect, as this subclause refers to PMA loopback mode, not to collision detection.

Text here makes no assumption with regards to the received signal (its shape, validity and so on) in the presence of collision.

The PMA Loopback is used for diagnostic purposes, and it is optional, thus current text is correct.

Cl 147 SC 147.5.6 P 197 L 31 # i-259

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status D PMA Electrical

Paragraph 4 is not true. Add conditional text to make it true.

*SuggestedRemedy*

Precede the current text with: "In the absence of collision..."

Proposed Response Response Status W

PROPOSED REJECT.

This subclause is about "PMA Local Loopback", so it is a means for the MAC client to verify underlying circuitry. In case of collision, COL is raised and MAC client can act accordingly.

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status D Management

I don't understand how the last sentence of this paragraph works in an actual implementation. I think a compliant (as opposed to interoperable in some fixed configuration) implementation is required to have control bits. Ifso, there has to be a way to test their existence and function. I don't see how you get there from the present text.

SuggestedRemedy

Put in a testable requirement to access the configurable aspects.

Proposed Response Response Status W

PROPOSED REJECT.  
The identical language is used in several 802.3 clauses with respect to control, in particular in clause 45 which governs the registers. Commenter is incorrect. While the implementation of the MDIO interface is optional, and an equivalent mechanism is recommended, the implementation is NOT required to have the control bits. An equivalent means of control and configuration (e.g., with a different encoding of bits, or with strap pins) would be permitted. The existing text allows this.

Cl 147 SC 147.9 P 200 L 12 # i-261

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status R MDI

Since the MDI connector that is called out is not required there is no standardized way or specifically characterized test point where specification or conformance testing can be done on a multi-vendor repeatable basis.

SuggestedRemedy

Add text that permits alternate connections/connectors can be used in the application environment, that the compliance requirements (like other Ethernet PHYs) are specified and tested at the mating surface of the specified MDI connector.

Response Response Status C

REJECT.

The CRG disagrees with the commenter. Like other IEEE Std 802.3 single-pair PHYS, a single MDI connector is not specified in clauses 146 and 147. This is because requirements for the connector may be application specific. This has not proven to be a significant handicap for other single-pair 802.3 PHYs.

Cl 147 SC 147.9.3 P 203 L 36 # i-262

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status D MDI

The phrasing of this clause and the next one make it appear that this is a requirement for testing the wiring rather than as a test access point for testing the DTE. Further, the test limit for a withstand voltage has absolutely zero margin with respect to PoDL which is contrary to usual practice for withstand voltage requirements. Additionally, consideration should be given to the possibility of there being other voltages in a sheath shared with this instance of 10BASE-T1L such as PoE.

SuggestedRemedy

Change the text to make it clearer that this test is a test of the DTE as tested from the MDI. Raise the test limit to be more appropriate with traditional withstand limits (ref e.g. cl. 14, 10BASE-T) and real world requirements such as static discharge.

Comment Type ER Comment Status A Safety

The text's description of the relationship to safety may twitch the IEEE lawyers. I would prefer to state it in a manner that is a little more removed.

*SuggestedRemedy*

Replace paragraph with: Defining "intrinsically safe", an intrinsically safe system and the limits of parameters used for intrinsically safe communications circuits is established by International Standards (Ref: Please provide correct reference). The specification of 10BASE-T1L in Clause 146 is intended to be compatible with implementation of such intrinsically safe systems.

Response Response Status C

ACCEPT IN PRINCIPLE.

Replace sentences on page 236, lines 17-20 with,

The additional requirements to achieve equipment protection by intrinsic safety are described by International Standards (e.g., IEC 60079-11). Possible limits of parameters used for intrinsically safe communication circuits can be derived from these standards. The specification of 10BASE-T1L in Clause 146 is intended to be compatible with implementation of such intrinsically safe systems.

Cl 148 SC 148.1 P 214 L 12 # i-265

Thompson, Geoffrey Independent Consultant

Comment Type ER Comment Status D PLCA\_SCOPE

The first sentence refers to PLCA as though it is already a familiar, well understood and well specified protocol that is familiar to the reader by the time he gets to clause 148 of IEEE Std. 802.3. Such is hardly the case.

*SuggestedRemedy*

Add the following text to the last paragraph: "PLCA modifies the CSMA/CD shared media access method so that assured access is provided via the collision free round robin protocol specified in this clause." This is a necessary but not sufficient addition. We'll leave further detail requirements to later in the clause..

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Change "This clause specifies the optional Physical Layer Collision Avoidance (PLCA) capabilities.

PLCA is defined for half-duplex mode of operation only. The PLCA RS is specified for operation with the PHY defined in Clause 147 (10BASE-T1S).

PLCA is designed to work in conjunction with CSMA/CD and can be dynamically enabled or disabled via management interface."

to

"This clause specifies a reconciliation sublayer to provide optional Physical Layer Collision Avoidance (PLCA) capabilities. The PLCA RS is specified for operation with Clause 147 (10BASE-T1S) PHYs operating in half-duplex multidrop mode. When used as a reconciliation sublayer, it aligns data from the MAC with transmission opportunities of the physical layer and maps the physical layer signals to PLS primitives towards the MAC. The use of PLCA-enabled physical layers in CSMA/CD half-duplex shared-medium networks provides enhanced performance relative to CSMA/CD without PLCA by avoiding corruption of signals on the media itself. PLCA-enabled nodes can coexist with nodes without PLCA enabled on the same mixing segment, all using 802.3 CSMA/CD."

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status R PLCA

(Wrong page & section ref. Put here for sorting purposes) In the current configuration of the draft it appears that the BEHAVIOUR of the Late Collision Counter (30.3.1.1.10 aLateCollisions) is incomplete.

*SuggestedRemedy*

Augment the referenced BEHAVIOUR with a PLCA conditional statement that describes what causes a late collision in the PLCA case including whether it is a normal or error condition.

Response Response Status U

REJECT.

The CRG disagrees with the commenter. A late collision at the MAC is a late collision. Its definition is unchanged and no additional text is needed.

Cl 148 SC 148.2 P 214 L 42 # i-268

Thompson, Geoffrey Independent Consultant

Comment Type TR Comment Status D PLCA\_ID

This lack of a complete specification for full functionality is completely unprecedented for 10 Mb/s Ethernet and a major shortcoming. Plug and work, historically, has been a major factor in the success of Ethernet in face of the competition (which usually required a bunch of configuration before it would go on-line). Two examples of this in the history of Ethernet come to mind: (1) In the early days of 10 Mb/s full duplex and 100BASE-T early implementations of AutoNegotiation did not work very well. The failure of the promised plug 'n' play was a major marketing issue. (2) In the very first (3 Mb/s) version of Ethernet, DTEs only had 8 bit addresses. They had to have their addresses manually configured with push-on test leads as part of their installation process. This made the customer (most of whom were EEs or Computer Scientists) installation not possible and a technician had to be involved. Major network management problem.

*SuggestedRemedy*

Come up with and require availability of an automatic configuration app. No reason one shouldn't be able to use the CSMA/CD capability to (1) identify the stations on the local segment and (2) hand out the unique assigned node ID to each DTE.

Proposed Response Response Status W

PROPOSED REJECT.

Commenter provides insufficient information for a sufficient response. Defining an "automatic configuration app" may be a desirable feature, but appears to involve higher layer protocols and algorithms for configuration of the specified management parameters, which the CRG believes would be outside the scope of the

Cl 148 SC 148.3 P 215 L 5 # i-270

Thompson, Geoffrey Independent Consultant

Comment Type ER Comment Status X PLCA\_SCOPE

The "Relationship with other IEEE standards" is incorrect with respect to the ISO Layer Model, 802 tradition and precedent and previous 802.3 projects that fiddled with shared media access methods[1]. When 802 did its adaptation of the ISO 7 Layer Model it subdivided the Data Link Layer into the LLC Sublayer and the MAC Sublayer specifically so that there was a separate place in the overall 802 model that "performs access control functions for the shared medium in support of the (common) LLC Sublayer[2]". Properly placed, PLCA would conform to this model, or (more properly) PLCA and CSMA/CD together would supply a complete MAC Sublayer for PLCA operation that would have a "Distinct Identity" that is different from CSMA/CD - Ethernet. To make things fit into the desired product implementation for fitting to existing IP the new PLCA block could have both a top MII to interface to existing designs and a bottom MII to attach to the PHY in the conventional manner. [1] Clause 64, Clause 99 [2] IEEE Std 802-1990 Overview & Architecture

SuggestedRemedy

Remove the entire PLCA clause (148) and associated textual material plus references from the draft. This will eliminate any scope issues and bring the draft into fully into line with the letter and expectations of the project paperwork at all levels (i.e. PAR, CSD, 802.3 project Objectives) [Further, thoughts not needed to resolve my required comment. I would fully support the creation of a new project to take place either within 802.3 or in a new 802 Working Group to standardize what we now call PLCA as a MAC sublayer element where the other required elements for a full DTE standard are provided by reference to the relevant portions of the 802.3 standard, as appropriate.]

Proposed Response Response Status W

PROPOSED REJECT.

The CRG disagrees with the commenter's description of layering and the proper placement of PLCA in the layering model. PLCA performs the functions delegated by the 802.3 layer model to the physical layer - carrier sense and collision detection. Commenter seems to posit an implementation which is not described in the amendment, where the PLCA sublayer interfaces to the MAC via an MII. (a "top MII" per the commenter), whereas PLCA maintains the layering and communicates to the MAC via the primitives PLS\_CARRIER and PLS\_SIGNAL defined in IEEE Std 802.3, and communicates with the remainder of the physical layer through the MII interface. For more detail on how PLCA relates to OSI layering please see

[http://www.ieee802.org/3/cg/public/adhoc/brandt\\_020619\\_3cg\\_01a\\_adhoc.pdf](http://www.ieee802.org/3/cg/public/adhoc/brandt_020619_3cg_01a_adhoc.pdf).

Additionally, the fact that PLCA-enabled half-duplex CSMA/CD stations may operate with and coexist with non-PLCA enabled half-duplex CSMA/CD stations on the same mixing segment is evidence that PLCA is a physical-layer augmentation to the CSMA/CD half-duplex MAC and not a new MAC function in itself. See

[http://www.ieee802.org/3/cg/public/Jan2019/Tutorial\\_cg\\_0119\\_final.pdf](http://www.ieee802.org/3/cg/public/Jan2019/Tutorial_cg_0119_final.pdf) and

Link Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

CI 147 SC 147.3.3.4 P 181 L 23 # i-281

Huszak, Gergely

Kone

Comment Type T Comment Status D State Diagram

Descrambler needs 17 bits to lock and that is achieved by receiving 5 symbols.  
 Descrambler is fed by 4B symbols, so DECODE must be called to be able to do the feeding.  
 According to the current specification of the PCS\_RX FSM, DECODE is called only in DATA state.  
 If it is done this way, the first 5 actual data symbols would be garbage, as descrambler is not yet locked.  
 A fix is to spec PCS\_RX so, that this DECODE-and-feed task is already run in PRE state, so that by the time DATA state is reached, meaningful descrambling could be done, using the descrambler locked previously.  
 Moreover it is not specified what descrambler is to be fed, when DECODE fails.

*SuggestedRemedy*

1. Add the following sentence to the end of the paragraph that ends 181/23 (replacing its closing dot): ", and the return value of this function is implementation-dependent."
2. Add the following new condition to the end of the current content of PCS\_RX/PRE:

```
====
IF precnt > 3 THEN
<tab>DECODE(RXn-3)
END
====
```

Note: the index "-3" in RXn-3 already incorporates the comment that is submitted by Piergiorgio Beruto tagged INDEX

Comment Type TR Comment Status A AutoNeg

For 10BASE-T1L and 10BASE-T1S, the break\_link\_timer\_[HSM] duration is too short to ensure that the link partner will enter a Link Fail state.

For 10BASE-T1S, this is related to heartbeat transmission of SC 147.3.7.

For 10BASE-T1L, this is related to the lpi\_quiet\_timer and possibly also the silent\_timer (which dictate normal periods of silence).

*SuggestedRemedy*

Change break\_link\_timer\_[HSM] description as follows:

Timer for the amount of time to wait in order to assure that the link partner enters a Link Fail state.  
 For all PHY types except 10BASE-T1S and 10BASE-T1L, this timer shall expire 300 us to 305 us after being started.  
 For a 10BASE-T1S PHY, this timer shall expire 400 ms to 405 ms after being started.  
 For a 10BASE-T1L PHY, this timer shall expire 150 ms to 155 ms after being started.

Response Response Status C

ACCEPT IN PRINCIPLE.

Clause 98.5.2:

P.74, Line 29:

Replace:

break\_link\_timer\_[HSM]

Timer for the amount of time to wait in order to assure that the link partner enters a Link Fail state. The timer shall expire 300 µs to 305 µs after being started.

With:

break\_link\_timer\_[HSM]

Timer for the amount of time to wait in TRANSMIT DISABLE in order to assure that the link partner will exit from either ACKNOWLEDGE DETECT or NEXT PAGE WAIT; effect on the link partner in other states is not defined. The timer shall expire 300 µs to 305 µs after being started.

P.75, Line 42:

Replace:

break\_link\_timer\_[LSM]

Timer for the amount of time to wait in order to assure that the link partner enters a Link Fail state. The timer shall expire 300 µs to 305 µs after being started.

With:

break\_link\_timer\_[LSM]

Timer for the amount of time to wait in TRANSMIT DISABLE in order to assure that the link

Link Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

partner will exit from either ACKNOWLEDGE DETECT or NEXT PAGE WAIT; effect on the link partner in other states is not defined. The timer shall expire 8000 μs to 8133 μs after being started.

Comment Type T Comment Status D PCS

The delimiters SSD4 and ESD4/ESD\_ERR4, as defined in Table 146-3, are always the same. If a PHY is transmitting a stream of packets of constant length and with a fixed interpacket gap, there will therefore be a non-zero value in the auto-correlation sequence of the transmitted signal. This will produce a harmonic in the transmit power spectrum. This could be avoided by randomizing the sign of the delimiters.

SuggestedRemedy

Add scheme to randomize the sign of the delimiters.

Proposed Response Response Status W

PROPOSED REJECT.

McCarthy, Mick

Analog Devices Inc.

Comment Type T Comment Status D EEE

10BASE-T1L LPI signalling is driven primarily by MII data traffic. No attempt has been made to introduce a scheme that synchronizes LPI quiet/refresh cycling between MASTER and SLAVE PHYs. There is little predictability to LPI quiet/refresh cycling because of this, making implementation more complex.

SuggestedRemedy

Add LPI quiet/refresh cycling, synchronized using loc\_lpi\_req signalling during link startup. A PHY implementation could use this scheme to know when link partner will be sending an LPI refresh state. See attached document.

Proposed Response Response Status W

PROPOSED REJECT.

Only 1000BASE-T1 has synchronization for LPI quiet-refresh, whereas the other BASE-T PHYs with a similar quiet-refresh cycle (10GBASE-T and the other MultiGBASE-T PHYs) do not. Adding synchronization of quiet/refresh cycling would be the addition of a new, non-essential feature to 802.3cg without quantified benefit.

Beruto, Piergiorgio

Canova Tech S.r.l.

Comment Type E Comment Status A State Diagram

In Figure 147-4 in the SILENT state, the tx\_sym variable is assigned to the tx\_cmd variable. However, if the tx\_cmd variable changes to a value other than COMMIT, the tx\_sym variable is not updated as a result of a missing recirculating arc on the SILENT state. This is not the intended behavior as the tx\_cmd is used to convey HB or BEACON signaling while the PCS Transmit State Diagram is still in SILENT state.

SuggestedRemedy

In Figure 147-4 add a recirculating arc to the silent state with the following condition: STD \* !pcs\_txen \* tx\_cmd != COMMIT with editorial license to format the expression according to IEEE style manual.

Response Response Status C

ACCEPT IN PRINCIPLE.

In Figure 147-4 add a recirculating arc to the silent state with the following condition: STD \* (!pcs\_txen) \* (tx\_cmd != COMMIT)

(use not-equal symbol for !=)

Comment Type **TR** Comment Status **R** Editorial

On link coupling attenuation limit it was decided to do the same as other limits but as being the first measurement standard specifying .1 MHz to add it in the list of references.

*SuggestedRemedy*

Add "IEC 62153-4-9 Ed2 Amd1: Coupling attenuation of screened balanced cables, triaxial method" in the list if Normative references

Response Response Status **W**

REJECT.

CRG disagrees with the commenter. IEC 62153-4-9 does not appear in the draft as a reference or normative requirement and, therefore, cannot be added as a Normative reference.

Cl 01 SC 1.4 P 29 L 51 # i-289

Schicketanz, Dieter University of Applied Science Reutlingen

Comment Type **TR** Comment Status **R** Editorial

The definition of T1S shows the same wording as T1L. Only the reach is different. But this is not the only difference. It may be additionally a point to multipoint System and only half duplex. No optional PoDL is described. It may be also 25m long.

*SuggestedRemedy*

This needs some editing by a native speaker. As the commenter is not able to do this in good english he would grant editor liscence to do so

Response Response Status **W**

REJECT.

Proposed change in the comment does not contain sufficient detail so that the CRG can understand the specific changes that will satisfy the commenter.

The CRG disagrees with the commenter. The comment appears to desire some tutorial text on some certain aspects of Clause 146, Clause 147 and, possibly, Clause 104. The applicable clauses are referenced in the current text. Further information and exposition are not appropriate for the definition.

and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Cl 00 SC 0 P L # i-290

Schicketanz, Dieter University of Applied Science Reutlingen

Comment Type G Comment Status R Multidrop

in clause 147.1 to 147.1.2 the new multidrop usage is described but the System interrelation and possible limitations description are missing. Questions are: 1- can multidrop segments be cascaded to form a tree and if yes how many. 2- How long can be a new link attached to a drop (after the phy not the stub). 3-How many electronics(e.g. switches) can be attached to each drop? 4- is energy efficiency an option? There may be additional questions!

*SuggestedRemedy*

Add a clause here or at an other place explaining the new multidrop advantages and limitations. The simplest example would be an automotive door.

Response Response Status C

REJECT.

The CRG disagrees with the commenter. The commenter did not provide a proposed resolution in sufficient detail to readily determine the specific wording of changes that will cause him to change his vote to approve (see SASB Ops Manual clause 5.4.3.2,b).

Comment is unclear as to whether it requests tutorial applications information or if specifications are missing. The specification provides the maximum insertion loss and delay associated with a mixing segment which defines the configurations. Termination requirements are given. Which specifications may be missing is unclear.

If the commenter means for tutorial applications information, then the standard is not a tutorial.

Table 104-1a needs changes: 1-classes 10-12 for 36 V are outdated and should be deleted. 2-one more 60V class should be added

### Suggested Remedy

1-classes 10-12 for 36 V are outdated and should be deleted. 2-one more 60V class should be added

Response Response Status **W**

ACCEPT IN PRINCIPLE.

Accommodated by comment i-321.

Response to comment i-321 is:

Add additional power classes, including control registers, and adjust loop resistances as shown in [http://www.ieee802.org/3/cg/public/May2019/stewart\\_3cg\\_01\\_0519\\_v3.pdf](http://www.ieee802.org/3/cg/public/May2019/stewart_3cg_01_0519_v3.pdf), by making the following changes: (references to "Stewart comment i-321 presentation" below are to this URL).

Modify Clause 30 to reflect new classes as follows:

Add new edit on (P41, L20):

Change text of BEHAVIOUR DEFINED AS section of 30.15.1.1.6 as shown:

"BEHAVIOUR DEFINED AS:

A read-only value that indicates the class of the detected PoDL PD as specified in Table 104-1 <UL>and Table 104-1a<UL>.

This value is only valid while a PD is being powered, that is the attribute aPoDLPSEPowerDetectionStatus is reporting the enumeration "deliveringPower".

If a Clause 45 MDIO Interface to the PoDL PSE function is present, then this attribute may be derived from the PD Class <UL>and PD Extended Class<UL> bits specified in 45.2.9.2.8 <UL>and 45.2.9.3.1a<UL>:"

Update the PoDL PSE Status registers to support the new classes as follows:

Modify Table 45-340 PoDL PSE Status 1 (P62) and Table 45-341 PoDL PSE Status 2 Register Bit Definitions (P63) to extend class codes as shown on slide 7 of Stewart comment i-321 presentation.

Update the PoDL Class register and Change the last sentence of the 45.2.9.2.8 (P62) from: When read as 0000 a Class 0 PD is indicated..., and when read as 1111 a Class 15 PD is indicated."

To:

"When read as 0000 a Class 0 PD is indicated..., and when read as 1111 the Class will be as indicated by the PD Extended Class (13.2.4:3) bits."

Add new subclause 45.2.9.3.1a PD Extended Class (13.2.4:3) to the draft, with editing instruction:

"Insert New subclause 45.2.9.3.1a PD Extended Class (13.2.4:3) after 45.2.9.3.1. Add text under 45.2.9.3.1a as below:"

"When read as 00 a Class 15 PD is indicated. Values of 01 and 1x are reserved."

Change the edit to last 3 sentences of the first paragraph of 104.2 Link segment (P86 L28-31) from:

"The link segment dc loop resistance shall be less than 59 ohm for Classes 10 and 13. The link segment dc loop resistance shall be less than 39 ohm for classes 11 and 14. The link segment dc loop resistance shall be less than 36 ohm for classes 12 and 15."

To "The link segment dc loop resistance shall be less than 65 ohm for classes 10 and 13. The link segment dc loop resistance shall be less than 25 ohm for classes 11 and 14. The link segment dc loop resistance shall be less than 9.5 ohm for Classes 12 and 15"

And, change the edit to Table 104-1a (P87 L1-22) deleting the last two rows (Cable mm (AWG) and Cable Length (m)) and modifying the entries in classes 10 through 15, as shown on Slide 10 of Stewart comment i-321 presentation.

Change Table 104-4 items 6 and 7 (Page 89 L22) to change class on existing values to Classes 0 to 9, and add new row for requirements on Classes 10 to 15 as shown on slide 11 of Stewart comment i-321 presentation.

Add new entries to Table 104-7 PD Power Supply limits table (Page 91 line 20), inserting new rows 4f, 4g and 5f, 5g for turn on and turn off voltages for the 2 new groups of classes respectively as shown on slide 12 of Stewart comment i-321 presentation, and add new entry for item 7 in Table 104-7 Inrush enable delay time for Classes 10 to 15 as shown on slide 13 of Stewart comment i-321 presentation.

Change Table 104-8 item 1 (Page 95 line 10) to change class on existing values of PSE Pull-up Voltage to apply to Classes 0 to 9, and add new row for requirement on Classes 10 to 15 as shown on slide 14 of Stewart comment i-321 presentation.

Editorial license granted to craft necessary Editing Instruction text in accordance with IEEE style.

## Ind Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Cl 104 SC 104.3 P 87 L 19 # i-295

Schicketanz, Dieter University of Applied Science Reutlingen

Comment Type TR Comment Status A PoDL

In Table 104-1a cable related limits are specified in the last two lines. As this is outside scope it should be replaced just by the loop resistance, giving the IEC cable group the task to define the cables. In Annex 146B there is an informative Table 146B-1 showing a lot of details.

### Suggested Remedy

The new classes 10 to 13 should show in the last row 9.25; 15; 25; 65 Ohm loop resistance at 60 C

CI 146 SC 146.1 P 104 L 15 # i-296  
 Schicketanz, Dieter University of Applied Science Reutlingen  
 Comment Type T Comment Status D PMA Electrical  
 As there are 2 link segment implementations (one for 2.4 Volt and one for 1 Volt) this sentence needs to be defined differently. As this occurs at a lot of places it is proposed to define everything to 2.4V 1000m link only  
 SuggestedRemedy  
 Add at line 16 after " this clause are met" For insertion loss take Equation 146-10.  
 Proposed Response Response Status W  
 PROPOSED REJECT.  
 Existing text references the normative requirements in this clause. The normative requirements for the link segment would be relative to the transmit output voltage modes that the PHY supports. When the (optional) 2.4 Vpp mode is supported and selected, that would be Equation 146-10, but when the (mandatory) 1.0 Vpp mode is supported, that would be 146-11.  
 This is clear in 146.7.1.1

CI 146 SC 146.5.5.3 P 144 L 28 # i-297  
 Schicketanz, Dieter University of Applied Science Reutlingen  
 Comment Type T Comment Status D PMA Electrical  
 There are 2 link equations either use one or define for both.  
 SuggestedRemedy  
 Insert after 146.7 with ll from equation 146-10  
 Proposed Response Response Status W  
 PROPOSED REJECT.  
 The existing reference to 146.7 is clear. When the link is using the optional 2.4 Vpp mode, the insertion loss limit of a link compliant to 146.7 is equation 146-10, when the transmitters are in 1.0 Vpp mode, the limit is equation 146-11.

 Schicketanz, Dieter University of Applied Science Reutlingen  
 Comment Type T Comment Status A Link Segment  
 How does the cabling knows that the PHY is in the 1 Volt Mode? Especially because it is not set automatically fort shorter links!  
 SuggestedRemedy  
 Tod avoid this issue it is proposed that the PHY switches to the 1 Volt Mode automatically if the Link has an IL less than 15 dB at 3.75 MHz  
 Response Response Status C  
 ACCEPT IN PRINCIPLE.  
 Accommodated by comment i-169. The resolution to comment i-169 is:  
 Divide existing 146.7.1.1 into 2 subclauses:  
 146.7.1.1.1 Insertion loss for PHYs in the 2.4 Vpp operation mode (starts at P147 L36) and  
 146.7.1.1.2 Insertion loss supported for PHYs in 1.0 Vpp operation mode (starts at P148 L25, with "For PHYs in the 1.0...").

Add text to 146.7.1 "There are two link segment insertion loss specifications supported, depending on whether the 2.4 Vpp mode is supported and selected, as specified in 146.6.4. All 10BASE-T1L PHYs support the insertion loss specified in 146.7.1.2, but support of the insertion loss specified in 146.7.1.1 is only required when the 2.4 Vpp transmit/receive ability is operational.

CI 146 SC 146.7.1.2 P 149 L 27 # i-299  
 Schicketanz, Dieter University of Applied Science Reutlingen  
 Comment Type TR Comment Status A Link Segment  
 Return loss limits were changed often. The latest values were from a measured cable. Due to the high insertion loss the reach is much less then 1000m violating the 1000m objective. But there is an installed base and it should be a better route to capture this.  
 SuggestedRemedy  
 As the majority of the cables have an impedance around 100 ohm as a compromise return loss should be 15 dB from 1 MHz to 20 MHz and below 9+9f. To capture the special cable with high insertin loss there would be 2 exceptions. Long links could go down to 13 dB. The critical 10m should be avoided in short runs.  
 Response Response Status W  
 ACCEPT IN PRINCIPLE.  
 Accomodated by i-111. The resolution to i-111 is:

 Insert "10BASE-T1L, 10BASE-T1S, " in underline before "100 Mb/s, 1 Gb/s" at the bottom on the right column in Figure 22-1.

CI 22 SC 22.2.1.3.3 P 32 L 3 # i-306  
 Kabra, Lokesh Synopsys, Inc.  
 Comment Type G Comment Status R PLCA  
 Second paragraph in 22.2.1.3.3 states that ".. any transition of the CRS signal from asserted to deasserted must cause a transition of CARRIER\_STATUS from the CARRIER\_ON to the CARRIER\_OFF value". This is not adhered to when PLCA is activated or enabled. Hence suggest to add a paragraph (similar to the paragraph added for EEE exception)  
 SuggestedRemedy  
 Add new paragraph at end of 22.2.1.3.3.  
 When PLCA functions is enabled, CARRIER\_STATUS is overridden according to the behavior of the PLCA DATA state diagram (see 148.4.6)  
 Response Response Status C  
 REJECT.  
 The CRG disagrees with the commenter.  
 The PLCA Reconciliation Sublayer is an extension of the RS defined in Clause 22, as specified in 148.4.1. The mapping between the MII and the PLCA RS is defined in Clause 148.4.3, which includes the CARRIER\_STATUS parameter (which is set according to the PLCA data state diagram in 148.4.6, as the commenter indicated correctly). See also 148.4.3.3.  
 Additionally, 148.4.2 reads "When PLCA functions are not supported or are disabled by the management interface (plca\_en = FALSE), RS operation shall conform to the MII RS definition in Clause 22.". Therefore modifying the text in Clause 22 as the commenter suggests would create a recursive reference.

Baggett, Tim Microchip Technology, Inc.

Comment Type E Comment Status A State Diagram

The exit conditions from state BAD\_ESD in the PCS transmit state diagram in Figure 147-5 has caused some confusion and could be clarified. The exit condition from BAD\_ESD to UNJAB\_WAIT is: (STD \* !err \* xmit\_max\_timer\_done). However, the exit condition from BAD\_ESD to connector [B] is simply STD. Some readers have interpreted that the transition from BAD\_ESD to [B] would always be taken, rather than and "ELSE" type condition.

The exit conditions could be made more clear by changing the condition to transition from BAD\_ESD to [B] to be the complement of the transition condition from BAD\_ESD to UNJAB\_WAIT. Essentially, we only want to transition from BAD\_ESD:

- \* to UNJAB\_WAIT if xmit\_max\_timer\_done is true (indicating a jabber and transmitting ESDJAB)
- \* to [B] if there was an error (and transmitting ESDERR).

*SuggestedRemedy*

Change the transition condition from BAD\_ESD to the connector [B] from "STD" to "STD \* err"

Comment Type E Comment Status D Timers

\*\*\* Comment submitted with the file 100633500003-baggett\_3cg\_plca\_timing\_01\_0519.pdf attached \*\*\*

More specific guidance may be provided to the system integrator in selecting a proper value for the PLCA to\_timer when implementing a mixing segment that exceeds the "up to at least 25m" length or medium with different velocity of propagation. The following text change describes in additional detail the effects the medium propagation and PHY delays have in determining the transmit opportunity time.

See baggett\_3cg\_plca\_timing\_01\_0519.pdf

*Suggested Remedy*

Change the description of to\_timer in lines 45-52 to read as follows:

The transmit opportunity timer maps to aPLCATransmitOpportunityTimer. The timer value should meet Equation (148-2). to\_timer shall be set equal across the mixing segment for PLCA to work properly.

Duration: integer number between 1 and 255, expressed in bit times.

$to\_timer > \max(2 * t\_propldelay) + \max(TX\_EN \text{ sampled to MDI output}) + \max(MDI \text{ input to CRS asserted}) + \max(MDI \text{ input to CRS deasserted}) - \min(MDI \text{ input to CRS deasserted})$  (148-2)

where:

t\_propldelay is the propagation delay between any two nodes on the mixing segment, and the delay specifications are the maxima and minima for the PHY type on the mixing segment (for 10BASE-T1S, see 147.11).

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Change the description of to\_timer in lines 45-52 to read as follows:

-----

The transmit opportunity timer maps to aPLCATransmitOpportunityTimer. The timer value needs to meet Equation (148-2). to\_timer shall be set equal across the mixing segment for PLCA to work properly.

Duration: integer number between 1 and 255, expressed in bit times.

$to\_timer > \max(2 * t\_propldelay) + \max(TX\_EN \text{ sampled to MDI output}) + \max(MDI \text{ input to CRS asserted}) + \max(MDI \text{ input to CRS deasserted}) - \min(MDI \text{ input to CRS deasserted})$  (148-2)

where:

t\_propldelay is the propagation delay between any two nodes on the mixing segment, and the delay specifications are the maxima and minima for the PHY type on the mixing segment (for 10BASE-T1S, see 147.11).

-----

With respect to the suggested remedy the "should" statement at the beginning of the sentence has been replaced with a "needs to be" to be coherent with proposed resolution of comment i-272.

Modify Clause 30 to reflect new classes as follows:

Add new edit on (P41, L20):

Change text of BEHAVIOUR DEFINED AS section of 30.15.1.1.6 as shown:

"BEHAVIOUR DEFINED AS:

A read-only value that indicates the class of the detected PoDL PD as specified in Table 104-1 <UL>and Table 104-1a<UL>.

This value is only valid while a PD is being powered, that is the attribute aPoDLPSEPowerDetectionStatus is reporting the enumeration "deliveringPower".

If a Clause 45 MDIO Interface to the PoDL PSE function is present, then this attribute may be derived from the PD Class <UL>and PD Extended Class<UL> bits specified in 45.2.9.2.8 <UL>and 45.2.9.3.1a<UL>."

Update the PoDL PSE Status registers to support the new classes as follows:

Modify Table 45-340 PoDL PSE Status 1 (P62) and Table 45-341 PoDL PSE Status 2 Register Bit Definitions (P63) to extend class codes as shown on slide 7 of Stewart comment i-321 presentation.

Update the PoDL Class register and Change the last sentence of the 45.2.9.2.8 (P62) from: When read as 0000 a Class 0 PD is indicated..., and when read as 1111 a Class 15 PD is indicated."

To:

"When read as 0000 a Class 0 PD is indicated..., and when read as 1111 the Class will be as indicated by the PD Extended Class (13.2.4:3) bits."

Add new subclause 45.2.9.3.1a PD Extended Class (13.2.4:3) to the draft, with editing instruction:

"Insert New subclause 45.2.9.3.1a PD Extended Class (13.2.4:3) after 45.2.9.3.1. Add text under 45.2.9.3.1a as below:"

"When read as 00 a Class 15 PD is indicated. Values of 01 and 1x are reserved."

Change the edit to last 3 sentences of the first paragraph of 104.2 Link segment (P86 L28-31) from:

"The link segment dc loop resistance shall be less than 59 ohm for Classes 10 and 13. The link segment dc loop resistance shall be less than 39 ohm for classes 11 and 14. The link segment dc loop resistance shall be less than 36 ohm for classes 12 and 15."

To "The link segment dc loop resistance shall be less than 65 ohm for classes 10 and 13.

The link segment dc loop resistance shall be less than 25 ohm for classes 11 and 14. The link segment dc loop resistance shall be less than 9.5 ohm for Classes 12 and 15"

And, change the edit to Table 104-1a (P87 L1-22) deleting the last two rows (Cable mm (AWG) and Cable Length (m)) and modifying the entries in classes 10 through 15, as shown on Slide 10 of Stewart comment i-321 presentation.

Change Table 104-4 items 6 and 7 (Page 89 L22) to change class on existing values to Classes 0 to 9, and add new row for requirements on Classes 10 to 15 as shown on slide 11 of Stewart comment i-321 presentation.

Add new entries to Table 104-7 PD Power Supply limits table (Page 91 line 20), inserting new rows 4f, 4g and 5f, 5g for turn on and turn off voltages for the 2 new groups of classes respectively as shown on slide 12 of Stewart comment i-321 presentation, and add new entry for item 7 in Table 104-7 Inrush enable delay time for Classes 10 to 15 as shown on slide 13 of Stewart comment i-321 presentation.

Change Table 104-8 item 1 (Page 95 line 10) to change class on existing values of PSE Pull-up Voltage to apply to Classes 0 to 9, and add new row for requirement on Classes 10 to 15 as shown on slide 14 of Stewart comment i-321 presentation.

Comment Type E Comment Status A Editorial

Subclause 1.4.151 of IEEE Std 802.3-2018 reads 'BASE-T1: PHYs that belong to the set of specific Ethernet PCS/PMA/PMDs that operate on a single twisted-pair copper cable, including 100BASE-T1 and 1000BASE-T1. (See IEEE Std 802.3, Clause 96 and Clause 97.)'. This definition needs to be updated to add 10BASE-TS1 and 10BASE-TL1.

SuggestedRemedy

Suggest that the following change be added to subclause 1.4 of IEEE P802.3cg:

In subclause 1.4.151 of IEEE Std 802.3-2018, the text '... that operate on a single twisted-pair copper cable, including 100BASE-T1 and 1000BASE-T1. (See IEEE Std 802.3, Clause 96 and Clause 97.)' be changed to read "... that operate on a single twisted-pair copper cable, including 10BASE-T1S, 10BASE-T1L, 100BASE-T1 and 1000BASE-T1. (See IEEE Std 802.3, Clause 96, 97, 146 and 147).'

Response Response Status C

ACCEPT IN PRINCIPLE.

Insert editor's instruction, "Change the Definition for 1.4.151 BASE-T1 as follows:" on page 29, line 4.

Insert the definition for clause 1.4.151 BASE-T1 from IEEE Std 802.3-2018 after the editor's instruction.

Grant editorial license to show the change of

replace, "that operate on a single twisted-pair copper cable, including 100BASE-T1 and 1000BASE-T1. (See IEEE Std 802.3, Clause 96 and Clause 97.)"

with, "that operate on a single twisted-pair copper cable, including 10BASE-T1S, 10BASE-T1L, 100BASE-T1 and 1000BASE-T1. (See IEEE Std 802.3, Clause 96, Clause 97, Clause 146, and Clause 147)."

with appropriate strikeouts and underlines.

Comment Type T Comment Status A Editorial

There is no transition condition on the transition from the AN ENABLE state to the TRANSMIT DISABLE state. I note that the condition on the same transition in IEEE Std 802.3-2018 is `mr_autoneg_enable = true`, however since `mr_autoneg_enable = false` is an open arrow condition to the AN ENABLE state, the condition seems redundant, so I assume was removed to indicate an unconditional transition. If that is the case the transition should be marked with UCT (see IEEE Std 802.3-1018 subclause 21.5.3).

SuggestedRemedy

Mark the transition from the AN ENABLE state to the TRANSMIT DISABLE state, on exit from the AN ENABLE state, with 'UCT'.

Response Response Status C

ACCEPT IN PRINCIPLE.

On page 77, line 23: Mark the transition from the AN ENABLE state to the TRANSMIT DISABLE state, on exit from the AN ENABLE state, with ' `mr_autoneg_enable = true` ' as was used in IEEE 802.3-2018. Revert the state name from 'AN ENABLE' to 'Auto-Negotiation ENABLE' as was used in IEEE 802.3-2018.

On page 128, line 47: Change the RSTCD condition to an UCT condition between states DATA and DATA\_ERR"

 Comment Type T Comment Status A State Diagram  
 It is not clear to me why the mr\_autoneg\_enable variable would be set to true in the AN GOOD CHECK state. It is not possible to transition into the AN GOOD CHECK state if the mr\_autoneg\_enable variable is not already set to true due to the open arrow entry into the AN ENABLE state based on mr\_autoneg\_enable = false. In addition, mr\_autoneg\_enable is a register bit sourced from bit 7.512.12 Auto-Negotiation enable (see Table 98-7) so I don't see why this state diagram would want to overwrite the value sourced by the management entity in the register bit.  
 Finally, on review of the IEEE Std 802.3-2018 Arbitration state diagram I don't see this action in the AN GOOD CHECK state, but instead, I see the action link\_control\_[notHCD] <= DISABLE. I can see why that might have been removed as the only way to get to the AN GOOD CHECK state is from the COMPLETE ACKNOWLEDGE state from the ACKNOWLEDGE DETECT state where link\_control\_[all] <= DISABLE is one of the actions. But this doesn't explain the addition of the action mr\_autoneg\_enable = true.  
 SuggestedRemedy  
 Remove the action mr\_autoneg\_enable = true from the AN GOOD CHECK state.

 Comment Type T Comment Status A State Diagram  
 The 'timer value' for the detection\_timer is defined as (2.5 ms +/- 0.1 ms) + (random integer from 0 to 15) x (0.5 ms +/- 0.05 ms). Based on this the minimum value is 2.5 ms - 0.1 ms = 2.4 ms and the maximum is (2.5 ms + 0.1 ms) + (15 x (0.5 ms + 0.05 ms)) = 10.85 ms. It would, therefore, seem to imply that a fixed value between 2.4 ms and 10.85 ms can be chosen for the time. I suspect that this is not what is intended, and instead, the random number needs to be selected each time the time is restarted.  
 SuggestedRemedy  
 Suggest that the text 'A new random integer from 0 to 15 inclusive is generated every time the detection\_timer is started. The random value should be uniformly distributed.' is added to the end of the 'Timer value' text.

 Comment Type TR Comment Status A State Diagram  
 Is it correct that 'The PCS Transmit function shall conform to the PCS Transmit state diagram in Figure 146-5 ...' and that 'In each symbol period, PCS Transmit generates a symbol An provided to the PMA ...'? The PCS Transmit state diagram in Figure 146-5 changes state based on STD being true, with STD being an alias for symb\_triplet\_timer\_done, and the output of the PCS Transmit state diagram is tx\_symb\_triplet which is defined in subclause 146.3.3.1.1 'Variables' as 'A triplet of ternary symbols generated by the PCS Transmit function after 4B3T encoding.'  
 I think the problem is that there is another function within the PCS Transmit function that is missing from the PCS Transmit state diagram in Figure 146-5, the 'multiplexor' shown in Figure 146-6 'PCS transmit symbol generation'. This 'multiplexor' function operates at the symbol clock rate and serialises the tx\_symb\_triplet code-groups output by the PCS Transmit state diagram into individual symbols.  
 This may also explain when subclause 146.3.3.1.3 'Timers' defines the symb\_timer that is not used in the PCS Transmit state diagram in Figure 146-5.  
 SuggestedRemedy  
 [1] Insert a new subclause 146.3.3.2 titled 'PCS Transmit multiplexor state diagram' that reads 'In each symbol period, the PCS Transmit multiplexor generates a ternary symbol that can take the values of {-1, 0, +1} and passes it to the PMA sublayer via the PMA\_UNITDATA.request primitive. The nominal symbol clock frequency is specified in 146.5.4.5.'. Renumber the following subclauses as required.  
 [2] Add a new subclause 146.3.3.2.1 titled 'Variables' that reads:  
 pcs\_reset  
 The pcs\_reset parameter set by the PCS Reset function.  
 Values: TRUE or FALSE  
 tx\_symb\_vector  
 A ternary symbol generated through serialization of tx\_symb\_triplet. This symbol is conveyed to the PMA as the parameter of a PMA\_UNITDATA.request(tx\_symb\_vector) service primitive.  
 Values: A ternary transmit symbol. The ternary symbols may take on one of the values {-1, 0, +1}.  
 tx\_symb\_triplet(TAn, TBn, TCn)  
 A triplet of ternary symbols generated by the PCS Transmit state diagram. The element TAn is the first ternary symbol transmitted; TCn is the last ternary symbol transmitted.  
 Value: A triplet of ternary transmit symbols. Each of the ternary symbols may take on one of the values {-1, 0, +1}.  
 [4] Add a new subclause 146.3.3.2.2 titled 'Timers'. Move the symb\_timer definition from subclause 146.3.3.1.3 Timers to this new subclause.

and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

[5] Add a new subclause 146.3.3.2.4 'Abbreviations' that reads:

PUDR  
Alias for PMA\_UNITDATA.request(tx\_symb\_vector).

[6] Insert a new Figure 145-6 shown below (view using a non-proportional font such as courier), renumbering the following figures as required.

[7] Add text to subclause 146.3.3 'PCS Transmit' that reads 'The PCS Transmit function shall conform to the PCS Transmit state diagram in in Figure 146-5 and the PCS Transmit multiplexor state diagram in 146-6, and their associated state variables, functions, timers, and messages.'

[8] Delete the first and second paragraphs of subclause 146.3.3.1 'PCS Transmit State Diagram' as these not functions of the PCS Transmit state diagram which is what this

subclause is describing, change the text '... the PCS Transmit function passes ...' in the current third paragraph to read '... the PCS Transmit state diagram passes ...'.

 It is not clear to me on reading the draft if 4B3T encoding is only when Sdn[3:0] is being encoded in to ternary triplet as defined in Table 146-1 '4B3T encoding' or if it includes all the encoding defined in Figure 146-5 'PCS transmit state diagram' which also include ternary triplets such as COMMA and ESD4.  
 If it is the former, only the encoding defined in Table 146-1, the text 'A triplet of ternary symbols generated by the PCS Transmit function after 4B3T encoding.' in the tx\_symb\_triplet variable definition will need to be updated as tx\_symb\_triplet is also assigned values such as COMMA (see SSD COMMA1 VECTOR state) and ESD4 (see ESD VECTOR state).

SuggestedRemedy  
 See comment.  
 Proposed Response Response Status W  
 PROPOSED ACCEPT IN PRINCIPLE.  
 Change "A triplet of ternary symbols generated by the PCS Transmit function after 4B3T encoding." in the tx\_symb\_triplet variable definition (146.3.3.1.1, P118 L35) to "A triplet of ternary symbols generated by the PCS Transmit function. These include 4B3T encoded data and assigned values (see 146.3.3.2.6)."

Comment Type TR Comment Status D PMA

As illustrated in Figure 146-2 '10BASE-T1L PHY interfaces' and 146-3 'PCS reference diagram', and defined in IEEE Std 802.3-2018 subclause 22.2.2.1, TX\_CLK is sourced from the PHY to the RS, not the other way round. Despite this, I was unable to find a specification of TX\_CLK in Clause 146. Suggest that TX\_CLK is generated by symb\_triplet\_timer and that symb\_triplet\_timer be generated from symb\_timer.

SuggestedRemedy

[1] Change the description of the symb\_timer to read 'A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the PCS concurrently with symb\_timer\_done.'.

[2] Change the description of the symb\_triplet\_timer to read 'A continuous free-running timer that shall expire synchronously with every third expiration of symb\_timer. TX\_CLK (see 22.2.2.1) shall be generated from symb\_triplet\_timer with the rising edge of TX\_TCLK generated synchronously with symb\_triplet\_timer\_done.'.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

(commenter's proposed resolution + change to 146.4.5.4)

[1] Change the description of the symb\_timer to read 'A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the PCS concurrently with symb\_timer\_done.'.

[2] Change the description of the symb\_triplet\_timer to read 'A continuous free-running timer that shall expire synchronously with every third expiration of symb\_timer. TX\_CLK (see 22.2.2.1) shall be generated from symb\_triplet\_timer with the rising edge of TX\_TCLK generated synchronously with symb\_triplet\_timer\_done.'.

[3] Change 146.4.5.4 (P139 L43) to add new first paragraph:

"The clock recovery provides a synchronous clock for sampling the signal on the pair. While it may not drive the MII directly, the Clock Recovery function is the underlying root source of RX\_CLK."

Comment Type T Comment Status D State Diagram

In some cases, the result of a function is assigned to a variable, for example, the action in the ESD DISPRESET VECTOR state is tx\_symb\_triplet <= DISPRES(tx\_disparity), yet in other cases, there is no assignment, for example, the action in the SEND IDLE state is ENCODE(Sdn[3:0], tx\_disparity).

Suggest that there should be a consistent assignment of the result of a function to a variable within actions in state diagrams. Based on this:

[1] Change 'ENCODE(Sdn[3:0], tx\_disparity)' to read 'tx\_symb\_triplet <= ENCODE(Sdn[3:0], tx\_disparity)' in the SEND IDLE and TRANSMIT DATA in Figure 146-5 'PCS transmit state diagram'.

[2] Change 'DECODE (Rxn-5, rx\_disparity)' to read 'RXD[3:0] <= DECODE (Rxn-5, rx\_disparity)' in the DATA, FOURTH SSD, CHECK ESD COMMA2, CHECK ESD DISPRESET3, ESD, BAD ESD2, BAD ESD3, RX ERROR, CHECK ESD ESD4 and the BAD END states in Figure 146-8 'PCS receive state diagram (part a)' and Figure 146-9 'PCS receive state diagram (part b)'.

*SuggestedRemedy*

Suggest that there should be a consistent assignment of the result of a function to a variable within actions in state diagrams. Based on this:

[1] Change 'ENCODE(Sdn[3:0], tx\_disparity)' to read 'tx\_symb\_triplet <= ENCODE(Sdn[3:0], tx\_disparity)' in the SEND IDLE and TRANSMIT DATA in Figure 146-5 'PCS transmit state diagram'.

Comment Type T Comment Status D PCS

Subclause 146.3.3.2.1 'Side-stream scrambler polynomial', subclause 146.3.3.2.2 'Generation of Syn[3:0]' in combination of subclause 146.3.3.2.3 'Generation of scrambled bits Sdn[3:0]' define the requirements in respect to the generation of Sdn[3:0] which is input to the ENCODE() function in the SEND IDLE and TRANSMIT DATA states of Figure 146-5 'PCS transmit state diagram'.

Subclause 146.3.3.2.4 'Generation of ternary triplet in mode SEND\_N and SEND\_I', subclause 146.3.3.2.5 'Generation of ternary triplet in mode SEND\_Z' and subclause 146.3.3.2.6 'Generation of symbol sequence' then describes the encoding that is actually performed by Figure 146-5 'PCS transmit state diagram'. Since subclause 146.1.3 'Conventions in this clause' states that 'Should there be a discrepancy between a state diagram and descriptive text, the state diagram prevails.' the state diagram requirements override the subclause 146.3.3.2.4 shall statements.

*SuggestedRemedy*

- [1] Change the block '4B3T ENCODER' in Figure 146-6 'PCS transmit symbol generation' to read 'PCS transmit state diagram'.
- [2] Add TX\_CLK as an input to the 'PCS transmit state diagram' block as this is used as the tx\_symb\_triplet clock.
- [3] Insert a new subclause 146.3.3.3 titled 'Generation of scrambled bits Sdn[3:0]' that reads 'The scrambled bits Sdn[3:0] used by the ENCODE function defined in 146.3.3.1.2 are generated as follows.'
- [4] Renumber subclause 146.3.3.2.1 to 146.3.3.3.1, subclause 146.3.3.2.2 to 146.3.3.3.2 and subclause 146.3.3.2.3 to 146.3.3.3.3.
- [5] Insert a new subclause 146.3.3.4 titled 'Generation of ternary triplet' that reads 'The PCS transmit state diagram generates ternary triplets as follows.'
- [6] Renumber subclause 146.3.3.2.4 to 146.3.3.4.1, subclause 146.3.3.2.5 to 146.3.3.4.2 and subclause 146.3.3.2.6 to 146.3.3.4.
- [7] Reword subclause 146.3.3.4.1, 146.3.3.4.2 and 146.3.3.4 to be descriptive rather than normative.

Comment Type T Comment Status A Definitions

Subclause 1.4.319 of IEEE Std 802.3-2018 reads 'master Physical Layer (PHY): Within IEEE 802.3, in a 100BASE-T2 or 1000BASE-T link containing a pair of PHYs, the PHY that uses an external clock for generating its clock signals to determine the timing of transmitter and receiver operations. It also uses the master transmit scrambler generator polynomial for side-stream scrambling. Master and slave PHY status is determined during the Auto-Negotiation process that takes place prior to establishing the transmission link. See also: slave Physical Layer (PHY).'

This definition needs to be updated to add 10BASE-T1L, as well as several other PHYs that use master-slave timing, and to align to 10BASE-T1 and other PHYs that permit master-slave selection through management, hardware or Auto-Negotiation.

SuggestedRemedy

Suggest that the following changes be added to subclause 1.4 of IEEE P802.3cg:

[1] In subclause 1.4.319 of IEEE Std 802.3-2018, the text 'Within IEEE 802.3, in a 100BASE-T2 or 1000BASE-T link containing ...' be changed to read 'Within IEEE 802.3, in a 100BASE-T2, 1000BASE-T, 10GBASE-T, 25GBASE-T, 40GBASE-T, 10BASE-T1L, 100BASE-T1 or 1000BASE-T1 link containing ...'.

[2] In subclause 1.4.319 of IEEE Std 802.3-2018, the text 'Master and slave PHY status is determined during the Auto-Negotiation process that takes place prior to establishing the transmission link.' be changed to read 'Master and slave PHY status is determined during the Auto-Negotiation process that takes place prior to establishing the transmission link, or in the case of a PHY where Auto-Negotiation is optional and not used, Master and slave PHY status is determined by management or hardware configuration.'

[3] In subclause 1.4.456 of IEEE Std 802.3-2108, the text 'Within IEEE 802.3, in a 100BASE-T2 or 1000BASE-T link containing ...' be changed to read 'Within IEEE 802.3, in a 100BASE-T2, 1000BASE-T, 10GBASE-T, 25GBASE-T, 40GBASE-T, 10BASE-T1L, 100BASE-T1 or 1000BASE-T1 link containing ...'.

[4] In subclause 1.4.456 of IEEE Std 802.3-2108, the text 'Master and slave PHY status is determined during the Auto-Negotiation process that takes place prior to establishing the transmission link.' be changed to read 'Master and slave PHY status is determined during the Auto-Negotiation process that takes place prior to establishing the transmission link, or in the case of a PHY where Auto-Negotiation is optional and not used, Master and slave PHY status is determined by management or hardware configuration.'

 Comment Type TR Comment Status D State Diagram  
 There seems to be a disconnect between Figure 146-5 'PCS transmit state diagram' which outputs tx\_symb\_triplet, Figure 146-6 'PCS transmit symbol generation' that outputs tx\_symb\_triplet from a '4B3T ENCODER', and the text in subclause 146.3.3.2.5. While Figure 146-6 shows tx\_mode as an input to the 4B3T ENCODER that produces tx\_symb\_triplet, and subclause 146.3.3.2.5 says that 'The ternary triplet (TAn, TBn, TCn) shall be a zero vector (0, 0, 0) when tx\_mode = SEND\_Z.' the states diagrams in 146-4 and 146-5 would seem to produce a different result.

If tx\_mode = SEND\_Z the Figure 146-4 'PCS data transmission enabling state diagram' will be in the 'DISABLE DATA TRANSMISSION' state, setting both tx\_enable\_mii and tx\_error\_mii to FALSE. In turn, if tx\_enable\_mii = FALSE the Figure 146-5 'PCS transmit state diagram' will, if necessary return to and, remain in the 'SEND IDLE' state. This will result in tx\_symb\_triplet being set to the result of ENCODE(Sdn[3:0], tx\_disparity) and not (0, 0, 0) as required by subclause 146.3.3.2.5.

This appears to be a discrepancy between the state diagram and text requirements in respect to tx\_symb\_triplet, and since subclause 146.1.3 'Conventions in this clause' states that 'Should there be a discrepancy between a state diagram and descriptive text, the state diagram prevails.' tx\_symb\_triplet has to be set to ENCODE(Sdn[3:0], tx\_disparity) and not (0, 0, 0). I don't believe that this is intended.

SuggestedRemedy

[1] Add the following definition to subclause 146.3.3.1.5 'Constants':

ZERO

A vector of three zero symbols sent when tx\_mode = SEND\_Z as specified in subclause 146.3.3.2.5.

[2] Replace the action ENCODE(Sdn[3:0], tx\_disparity) in the SEND IDLE state of Figure 146-5 'PCS transmit state diagram' with:

```
IF(tx_mode = SEND_Z) THEN
    tx_symb_triplet <= ZERO
    tx_disparity <= 2
ELSE
    ENCODE(Sdn[3:0], tx_disparity)
END
```

The abbreviation 'NVP' is used subclause 146.7.1.3 'Maximum link delay' without definition in Clause 146, nor anywhere else in IEEE P802.3cg. I would imagine it is meant to be 'Nominal Velocity of Propagation', however I note that NVP is used in this subclause in reference to Equation (80-1) which uses the parameter n to represents the ratio of the speed of electromagnetic propagation in the cable to the speed of light in a vacuum, not NVP.

SuggestedRemedy

Change '... using Equation (80-1) with an NVP of 0.6.' to read '... using Equation (80-1) with an n of 0.6.' with 'n' italicised.

Comment Type TR Comment Status A PCS

The description for tx\_cmd as '5B symbol to be transmitted' doesn't seem to match some of its uses in Figure 147-4 'PCS Transmit state diagram' where it is used as part of the condition for a state transition and in an IF-THEN-ELSE is a state. These are the transition from the SILENT state to the COMMIT state that includes tx\_cmd = COMMIT, and in the ESD state where actions depend on tx\_cmd != COMMIT. In these cases, tx\_cmd would appear to be the command being conveyed from a PLCA RS to the PHY via the MII. This seems to be confirmed by the text 'The tx\_cmd variable is assigned according to the RS signaling over MII interface ...' in the tx\_cmd variable description.

There is then the action tx\_sym <= tx\_cmd in the SILENT state but that seems to need a function to translate the value of tx\_cmd, as well as hb\_cmd, to determine the symbol to send.

Finally, I can't find the COMMAND state mentioned in the text '... when the PCS Transmit function is in COMMAND state.' of the tx\_cmd variable description.

Suggested Remedy

[1] Change the definition of tx\_cmd to read:

tx\_cmd  
Encoding present on TXD<3:0>, TX\_ER, and TX\_DV as defined in Table 22-1.  
Values:  
BEACON: PLCA BEACON indication encoding present on TXD<3:0>, TX\_ER, and TX\_DV.  
COMMIT: PLCA COMMIT indication encoding present on TXD<3:0>, TX\_ER, and TX\_DV.

[2] Define when tx\_cmd is set to SILENCE.

[3] Add the following to 147.3.2.4 changing the title to 'Functions':

TXCMD\_ENCODE  
In the PCS transmit process, this function takes as its arguments the values of tx\_cmd and hb\_cmd variables and returns a 5B symbol based on the following mapping:

'N' when the tx\_cmd variable is set to BEACON,  
'J' when the tx\_cmd variable is set to COMMIT,  
'T' when the hb\_cmd variable is set to HEARTBEAT and the tx\_cmd variable is not set to BEACON or COMMIT,  
'I' otherwise.

[4] Change the action 'tx\_sym <= tx\_cmd' in the SILENT state of Figure 147-4 'PCS Transmit state diagram' to read 'tx\_sym <= TXCMD\_ENCODE(tx\_cmd, hb\_cmd)'.

Response Response Status C

ACCEPT IN PRINCIPLE.

1. Change the definition of tx\_cmd to read:

====

tx\_cmd

Encoding present on TXD<3:0>, TX\_ER, and TX\_EN as defined in Table 22-1.

Values:

BEACON: PLCA BEACON indication encoding present on TXD<3:0>, TX\_ER, and TX\_EN.

COMMIT: PLCA COMMIT indication encoding present on TXD<3:0>, TX\_ER, and TX\_EN.

SILENCE: TXD<3:0> does not encode any of the above requests, or TX\_ER = FALSE, or TX\_ER = TRUE.

====

2. Add the following to 147.3.2.4 changing the title to 'Functions':

====

TXCMD\_ENCODE

In the PCS transmit process, this function takes as its arguments the values of tx\_cmd and hb\_cmd variables and returns a 5B symbol based on the following mapping:

'N' when the tx\_cmd variable is set to BEACON,

'J' when the tx\_cmd variable is set to COMMIT,

'T' when the hb\_cmd variable is set to HEARTBEAT and the tx\_cmd variable is not set to BEACON or COMMIT,

'I' otherwise.

====

3. Change the action 'tx\_sym <= tx\_cmd' in the SILENT state of Figure 147-4 'PCS Transmit state diagram' to read 'tx\_sym <= TXCMD\_ENCODE(tx\_cmd, hb\_cmd)'.

Comment Type TR Comment Status A PCS

As illustrated in Figure 147-2 '10BASE-T1S PHY interfaces' and Figure 147-3 'PCS reference diagram', and defined in IEEE Std 802.3-2018 subclause 22.2.2.1, TX\_CLK is sourced from the PHY to the RS. Despite this, I was unable to find a specification of TX\_CLK in Clause 146. Suggest that TX\_CLK is generated from a symb\_timer and STD is an alias for symb\_timer\_done.

SuggestedRemedy

[1] Insert a new subclause 147.3.2.5 titled 'Timer' that reads as follows, renumber subsequent subclauses as required.

5B\_symb\_timer

A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the PCS concurrently with 5B\_symb\_timer\_done. TX\_CLK (see 22.2.2.1) shall be generated from 5B\_symb\_timer with the rising edge of TX\_TCLK generated synchronously with 5B\_symb\_timer\_done.

Duration: Five DME clock transition to clock transition times (see Table 147-3)

[2] Change current subclause 147.3.2.5 'Abbreviations' to read:

STD

Alias for 5B\_symb\_timer\_done.

Response Response Status C

ACCEPT IN PRINCIPLE.

Accommodated by comment i-423. Response to comment i-423 is:

ACCEPT IN PRINCIPLE.

Multiple editorial changes are required in both the PCS Receive and PCS Transmit functions subclauses to address the lack of clarity pointed out by the commenter.

Editorial license to align other comments with the variable name changes in this comment response, and to re-alphabetize variable names in lists as necessary.

Throughout the whole subclause 147.3.2 (including figures) apply the following changes:

- replace all occurrences of "pcs\_txen" with "TX\_EN"
- replace all occurrences of "pcs\_txer" with "TX\_ER"
- replace all occurrences of "pcs\_txd" with "TXD"

Throughout the whole subclause 147.3.3 (including figures) apply the following changes:

- replace all occurrences of "pcs\_rxdv" with "RX\_DV"
- replace all occurrences of "pcs\_rxe" with "RX\_ER"
- replace all occurrences of "pcs\_rxd" with "RXD"

At page 170, line 42 replace "with every PCS transmit clock cycle" to "with every symb\_timer expiration. The symb\_timer is defined in 147.3.2.7."

At page 177, line 33 change the description of the "tx\_sym" variable to: "5B symbol to be conveyed to the PMA Transmit function by the means of the PMA\_UNITDATA.request primitive specified in 147.2.2."

At page 178, line 24 change the description of the "ENCODE" function to: "This function takes a 4 bit input parameter Scn<3:0> and returns a 5B symbol according to the following procedure:

1. Convert Scn<3:0> into Sdn<3:0> as specified in 147.3.2.6.
2. Convert Sdn<3:0> (4B symbol) into the corresponding 5B symbol defined in Table 147-1."

At page 179, line 24 change the description of the "STD" abbreviation to: "Alias for symbol timer done."

At page 179, line 32, change the second paragraph (starting with "An implementation of ..." to read:

"An implementation of a self-synchronizing scrambler by a linear-feedback shift register is shown in Figure 147-6. The bits stored in the shift register delay line at time n are denoted by Scrn<16:0>. The '+' symbol denotes the exclusive OR logical operation. When Scn<3:0> is presented at the input of the scrambler, Sdn<3:0> is produced by shifting in each bit of Scn<3:0> as Scn<i>, with i ranging from 0 to 3 (i.e., LSB first). The scrambler is reset upon execution of the PCS Reset function. If the PCS Reset is executed, all bits of the 17-bit vector representing the self-synchronizing scrambler state are arbitrarily set. The initialization of the scrambler state is left to the implementer. In no case shall the scrambler state be initialized to all zeroes. At every STD, if no data is presented at the scrambler input via Scn<3:0>, the scrambler may be fed with arbitrary inputs."

At page 180, line 8, append the following text to subclause 147.3.2.7:

"symb\_timer

A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the PCS concurrently with symb\_timer\_done (see 147.2.2). TX\_CLK (see 22.2.2.1) shall be generated from 5B\_symb\_timer with the rising edge of TX\_TCLK generated synchronously with 5B\_symb\_timer\_done.

Continuous timer: The condition symb\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration.

Duration: 400 ns ± 100 ppm (see 22.2.2.1)"

At page 179 in Figure 147-6 perform the following changes:

- replace "TXDn[i]" with "Scn<i>". Please note the 'n' is a subscript
- replace all square brackets '[' with angular brackets '<>'

At page 180, line 9, change the description of the "RXn" variable to read:

"The rx\_sym parameter of the PMA\_UNITADATA.indication primitive defined in 147.2.1.

The 'n' subscript denotes the rx\_sym conveyed in the most recent rcv\_symb\_conv\_timer cycle.

The 'n-x' subscript indicates the rx\_sym conveyed 'x' cycles behind the most recent one."

At page 181, line 18, change the description of the "DECODE" function to read:

"This function takes a 5B symbol input parameter and returns a 4 bit value Dcn<3:0> value

## and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

according to the following procedure:

1. Convert the 5B input symbol into Drn<3:0> by performing a reverse lookup of Table 147-1. If no 4B value is associated to the given 5B symbol, the PCS Receive function shall assert RX\_ER for at least one symbol period and Drn<3:0> may be set arbitrarily.
2. Convert Drn<3:0> to Dcn<3:0> as specified in 147.3.3.7."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

At page 181, line 26, change the description of the "RSCD" abbreviation to read:  
"Alias for recv\_symb\_conv\_timer\_done."

At page 183, line 48, insert a new subclause 147.3.3.x with name "Timers" between existing subclauses 147.3.3.7 and 147.3.3.8.

Add the following text to the newly created subclause:

"recv\_symb\_conv\_timer

A continuous timer which expires when the PMA\_UNITDATA.indication message is generated (see 147.2.1).

Continuous timer: The condition recv\_symb\_conv\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration.

Duration: timed by the PMA\_UNITDATA.indication message generation."

Perform renumbering of the subclauses accordingly.

At page 183, line 28 change the whole paragraph starting with "The PCS receive function shall ..." to read:

"The PCS Receive function descrambles the 5B/4B decoded data stream and returns the value of RXD<3:0> to the MII. The descrambler shall employ the polynomial defined in 147.3.2.6. The implementation of the self-synchronizing descrambler by linear-feedback shift register is shown in Figure 147-9. The bits stored in the shift register delay line at time n are denoted by Dcrn<16:0>. The '+' symbol denotes the exclusive OR logical operation. When Drn<3:0> is presented at the input of the descrambler, Dcn<3:0> is produced by shifting in each bit of Drn<3:0> as Drn<i>, with i ranging from 0 to 3 (i.e., LSB first). The descrambler is reset upon execution of the PCS Reset function. If PCS Reset is executed, all the bits of the 17-bit vector representing the self-synchronizing descrambler state are arbitrarily set. The initialization of the descrambler state is left to the implementer. At every RSCD, if no data is presented at the descrambler input via Drn<3:0>, the descrambler may be fed with arbitrary inputs."

Please note that the 'n' in the Dcn and Drn variables name is a subscript.

At page 183, in figure 147-9, perform the following changes:

- replace "RXDn[i]" with "DCn[i]"
- replace all square brackets '[' with angular brackets '<>'

At page 191, line 52, add the following text after "DME encoded stream received at the MDI.":

"The clock recovery provides a synchronous clock for sampling the signal on the pair.

While it may not drive the MII directly, the clock recovery function is the underlying source of RX\_CLK."

Clause 148, which specifies the PLCA Reconciliation Sublayer (RS), cannot place requirement (shall statements) on the connected PHY. Subclause 1.1.3.2 'Compatibility interfaces' of IEEE Std 802.3-2018 defines the MII as a compatibility interface. As such an implementer is permitted to implement only the Clause 148 RS, however having shall statements related to the PHY results in requirements that this RS implementer will be unable to satisfy. This can be seen in the PICS where a Clause 148 RS implementer is required to respond to questions about the PHY such as PLCA2 and PLCA3 where the status is M and the support is Yes[]. In addition a PLCA RS supports PHYs other than 10BASE-TS1.

*Suggested Remedy*

[1] Change 148.4.4 'Requirements for the PHY' to read 'In order to support Physical Layer Collision Avoidance the RS has to be connected to a 10BASE-TS1 PHY.

[2] Remove requirements on the PHY from Clause 148.

Comment Type TR Comment Status D State Diagram

There appears to be a conflict, or at least a lack of clarity, between the Figure 148-3 'PLCA Control state diagram' and the Figure 148-4 'PLCA DATA state diagram' in respect to which controls the encoding being placed on the MII transmit signals TXD, TX\_EN and TX\_ER by the PLCA RS.

As an example, when the PLCA Control state diagram is in the SEND\_BEACON state, one of the actions is tx\_cmd <= BEACON, which based on subclause 148.4.5.2 should result on the BEACON encoding defined in Table 22-1 being placed on TXD, TX\_EN and TX\_ER. At the same time that the PLCA Control state diagram is in the SEND\_BEACON state, it would appear that the PLCA DATA state diagram is in the IDLE state, and the actions within the IDLE state include TXD <= 0000 and TX\_EN <= FALSE. Hence we have the two different state diagrams requiring different values to be placed on TXD and TX\_EN at the same time resulting in a conflict.

Perhaps the intent is to have both state diagrams assign values to TXD and TX\_EN, but that isn't clear to me as one state diagram uses tx\_cmd and the other TXD and TX\_EN.

In addition, the states within the PLCA Control state diagram that have actions assigning values to tx\_cmd, and therefore potentially changing the values of TXD and TX\_EN, are not synchronised to TX\_CLK through the MCD variable in that way that actions that assign values to TXD and TX\_EN are in the 'PLCA DATA state diagram'. Not synchronising state changes in the PLCA Control state diagram change the value of tx\_cmd could result in transitions in TXD and TX\_EN that do not meet the timing requirements of IEEE Std 802.3-2018 subclause 22.3.1 'Signals that are synchronous to TX\_CLK'.

Finally, it isn't clear to me why TX\_ER would be an input to Figure 148-4 'PLCA DATA state diagram'. I was wondering if it was meant to be a plca\_txer variable derived from the MAC service interface, similar to the plca\_txen, but the MAC service interface doesn't provide the ability for the MAC to pass transmit errors to the RS.

One, I assume unintended, consequence of the use of TX\_ER is that when the PLCA RS with local\_nodeID=0 is transmitting a BEACON, and therefore TX\_ER = 1 (see Table 22-1), and then a transmission from the local MAC is started, it would appear that this transmission is discarded. This is due to the PLCA DATA state diagram transitioning from the IDLE state to the HOLD state due to plca\_txen, then to the ABORT state, which sets packetPending to FALSE discarding the packet, as a result of the transition condition (rcv\_timer\_not\_done \* MCD \* !committed \* TX\_ER \* !receiving) being true.

SuggestedRemedy

[1] Clarify the source of TXD and TX\_EN as either the Figure 148-3 'PLCA Control state diagram' or the Figure 148-4 'PLCA DATA state diagram'. If the intent is that both should source TXD and TX\_EN, suggest that tx\_cmd should be replaced with TXD, TX\_EN and TX\_ER in the respective PLCA Control state diagram states.

[2] Ensure that MCD is used in any condition that results in a change of value in TXD,

TX\_EN or TX\_ER in the PLCA Control state and PLCA DATA state diagrams.

[3] Clarify the use of TX\_ER in the transition condition from the HOLD to the ABORT state in the PLCA DATA state diagram.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Comment Type TR Comment Status D Timers

This subclause specifies the duration of the beacon\_timer as 20 bit times. IEEE Std 802.3-2018 subclause 1.4.160 'bit time' states that 'The bit time is the reciprocal of the bit rate. For example, for 100BASE-T the bit time is 10<sup>-8</sup> s or 10 ns.'. As a result in a duration of beacon\_timer is exactly 20 x reciprocal(10 Mb/s) = 2000 ns. This would seem to result in a requirement for infinite precision and make a beacon\_timer of 2000 + 10<sup>-15</sup> ns non-conformant.

SuggestedRemedy

Provide a tolerance for the beacon\_timer, burst\_timer, commit\_timer (subclause 148.4.6.4), hb\_send\_timer (subclause 147.3.7.1.2), hb\_timer (subclause 147.3.7.1.2) and link\_hold\_timer (subclause 147.3.7.2.3)

Proposed Response Response Status W

Comment Type E Comment Status A Editorial

As there are other instances of an actual counter within Figure 148-3 'PLCA Control state diagram' such as bc (see page 222, line 34) suggest that burst\_timer shouldn't be defined as 'Counts the time to wait ... in bit-times.'.

SuggestedRemedy

Suggest that the text 'Counts the time to wait for the MAC to send a new packet before yielding the transmit opportunity, in bit-times.' should be changed to read 'This timer determines how long to wait for the MAC to send a new packet before yielding the transmit opportunity.'.

Cl 148 SC 148 P 214 L 1 # i-390

Kim, Yongbum

NIO

Comment Type TR Comment Status D PLCA\_SCOPE

[PAR] PLCA Reconciliation Sublayer (RS) contain specifications that handles contention avoidance and collision handling as well as access control. Media Access Control (MAC) specification is not a part of this Physical Layer project, as stated in this PAR scope: "5.2.b. Changes in scope of the project: Specify additions to and appropriate modifications of IEEE Std 802.3 to add 10 Mb/s Physical Layer (PHY) specifications and management parameters for operation, and associated optional provision of power, using a single balanced pair of conductors.", whereas the MAC definition is in CL 4.1.1 of IEEE 802.3-2018 states: "...The MAC sublayer defines a medium-independent facility...b) Media Access Management  
1) Medium allocation (collision avoidance)  
2) Contention resolution (collision handling)."

Furthermore, Reconciliation Sublayer, as defined in the same parent document IEEE 802.3-2018, in 1.4.425 states "1.4.425 Reconciliation Sublayer (RS): A mapping function that reconciles the signals at the Media Independent Interface (MII) to the Media Access Control (MAC)-Physical Signaling Sublayer (PLS) service definitions. (See IEEE Std802.3, Clause 22.)". PLCA RS claims to be an RS, but does NOT simply map PLS to MII, but performs 1) Medium allocation (collision avoidance) -- as the title says ("physical layer Collision Avoidance), 2) Contention resolution (collision handling). PLCA performs Medium Access control function (MAC).

*SuggestedRemedy*

Align this draft to the approved PAR (14-May-2018)by deleting CL148 in its entirety (pages 214 through 234, inclusive) and any changes associated with such deletion. Alternatively, submit a new PAR that substantially reflect this project content, including a MAC specification in the scope, and provide approved PAR with such revised scope. If a new PAR is submitted with MAC specification in scope, then re-open and seek technical contributions with regards to the new scope.

Proposed Response Response Status W

PROPOSED REJECT.

Commenter incorrectly posits that the Clause 148 PLCA RS is a new MAC. It does not meet the requirements for a MAC, and, leaves the MAC functionality with Clause 4, which, in fact, it could not work without. Commenter incompletely quotes IEEE Std 802-2014 4.1, paragraph 6 leading to incorrect conclusions.

Comment Type TR Comment Status R Modes

[CSD] CSD/Broad Market Potential is no longer assured in this project when the half-duplex point to point link segment PHY operation, traditionally associated with broad market with use of star-wired multi-port repeaters (e.g. 10BASE-T hubs/repeaters) is not supported.

An explicit statement of mandatory operation of this PHY:  
"The 10BASE-T1S PHY is specified to be capable of operating at 10 Mb/s in several modes. All 10BASE-T1S PHYs can operate as a half-duplex PHY with a single link partner over a point-to-point link segment defined in 147.7..."

An explicit statement of non-support of repeaters:  
Pg 30, CL9.1 proposed change states "This clause specifies a repeater for use with IEEE 802.3 10 Mb/s baseband networks, with the exceptions of 10BASE-T1L (Clause 146) and 10BASE-T1S (Clause 147)...."

Repeating the concern -- only PHY operation that is mandatory is point-to-point link without any allowance for repeaters (i.e. exactly two node network) operating in half-duplex, contention resolution network does NOT have broad market potential.

*SuggestedRemedy*

Delete market-potential irrelevant PHY that supports exactly two node network over a point-to-point link, and make one of the more market-potential-relevant PHYs from "...additionally, there are two mutually exclusive optional operating modes: a full-duplex point-to-point mode over the link segment defined in 147.7, and a half-duplex shared-medium mode, referred to as multidrop mode,..." and update the CSD/Broad Market Potential as appropriate.

Response Response Status W

REJECT.

CRG disagrees with the commenter. The clause contains one PHY with three modes, with a common-denominator for interoperability. CRG disagrees with the commenter on the relevance of the mandatory mode of operation (half-duplex point-to-point). There are multiple methods of inter-linking point-to-point half-duplex segments, without the use of clause 9 repeaters using multiple topologies of choice, allowing larger networks (with more than 2 stations). A bridge is considered to be an element in common networks. Bridges have functionally replaced repeaters in most networks.

## Link Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

CL 147    SC 147.1    P 167    L 13    # i-392

Kim, Yongbum

NIO

Comment Type    TR    Comment Status    R    Modes

[CSD] CL147 title states a single PCS/PMA type 10BASE-T1S. But in reality, it has three PHYs. Two of the three PHYs not compatible and do not interoperate. This issue is explicitly stated with "mutually exclusive" operation, which equals not-compatible and not interoperate.

"All 10BASE-T1S PHYs can operate as a half-duplex PHY with a single link partner over a point-to-point link segment defined in 147.7, and, additionally, there are two mutually exclusive optional operating modes: a full-duplex point-to-point mode over the link segment defined in 147.7, and a half-duplex shared-medium mode, referred to as multidrop mode, capable of operating with multiple stations connected to a mixing segment, defined in 147.8."

Full-duplex P2P PHY implements echo cancelation. Half-duplex shared medium does not. They do not interoperate with each other. These may share the similar or substantially same PCS, these do not share PMAs. They do not interoperate; PMAs are substantially different; they are different PHYs. These two PHYs should be, at least, designated as different type.

If the argument is made that these two PHYs must support P2P half-duplex (therefore interoperate), and in such case, they interoperate, then we should also be reminded that P2P half-duplex (with no provision for repeaters) allow for exactly two node network collision based network. Exactly two node, and only two node, connectivity does not network make.

### *Suggested Remedy*

Either structure CL147 to specify two different PHY types, P2P full-duplex PHY, and 'multi-drop' half-duplex PHY. They do not interoperate with each other, therefore they are not the same type of PHY.

Or split CL147 into a CL on common PCS, and two more CLs, one for each of the two separate PMA for respective PHYs.

With regards to the P2P half-duplex PHY, please delete it from this draft. The value and use of exactly two (and only two) node network is very limited to say the least.

Response    Response Status    W

REJECT.

The CRG disagrees with the commenter. The clause contains one PHY with a common-denominator for interoperability. CRG disagrees with the commenter that the modes do not interoperate.

The commenter seems to make multiple incorrect interpretations of the text. Mutual exclusivity is with regards to the fact that a single PHY cannot operate in half-duplex and full-duplex at the same time. The PHY contains a single PCS, and a single PMA is specified along with options.

Regarding the half-duplex point-to-point functionality, there are multiple methods of inter-linking point-to-point half-duplex segments, without the use of clause 9 repeaters using multiple topologies of choice, allowing larger networks (with more than 2 stations). A bridge is considered to be an element in common networks. Bridges have functionally replaced repeaters in most networks.

Standard Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Cl 148 SC 148 P 214 L 1 # i-393

Kim, Yongbum

NIO

Comment Type TR Comment Status D PLCA\_SCOPE

[CSD] CSD/Economic Feasibility statements in CSD document is not valid for CL148 PLCA operation.

The project CSD states that "

The cost factors for Ethernet components and systems are well known. The proposed project may introduce new cost factors which can be quantified.

-The reduction in the number of legacy networks requiring specialized components, expertise, and gateways in the targeted markets is anticipated to result in a significant drop in both installation and operational costs."

While the cost factors for Ethernet is well known, this project introduces the new requirements that has not been a part of Ethernet. This project requires each node to be assigned a unique and sequential (as in little to no gaps in number sequence) node identifier to be assigned to each PHY, and allocate and assign a special node identifier value of zero to a 'master node' that is responsible for sending special 'beacon' frame. This project requires that the configuration is assured (outside of this draft standard) that node identifier of zero is present, and only one of such node identifier is present. This operation described in this project cannot reasonably assume that this new behavior requirement could inherit "well known Ethernet cost factors". Also this project cannot reasonably assert "drop in both installation and operational costs" when additional configuration of node assignment and behaviors are required and without any specification on how they are done.

CSD/Economic Feasibility with regard to other clauses, other than CL148, are not in question.

*SuggestedRemedy*

CSD/Economic Feasibility with regard to CL148 PLCA operation is no longer valid and grossly incorrect. Appropriate changes to the CSD/Economic Feasibility to be made and to be approved.

Proposed Response Response Status W

PROPOSED REJECT.

Commenter improperly refers to CSDs which are not in scope for a Standards Association Ballot.

Additionally, commenter is incorrect. A number of individuals with a broad spectrum of affiliations agreed on an objective for this. The Criteria for Standards Development (e.g., broad market potential) apply to the entire standard:

=====

Each proposed IEEE 802 LMSC standard shall have broad market potential. At a minimum, address the following areas:

- a) Broad sets of applicability.
- B) Multiple vendors and numerous users.

=====

The existing 802.3cg broad market potential speaks to 10 Mb/s single-pair Ethernet in industrial, automotive, and intra-system applications, and the number and breadth of

individuals and companies which have expressed interest in the standard.

Furthermore the commenter is technically incorrect in his assertions:

- [1] PLCA node IDs do not need to be sequential
- [2] There is no such description of master node in the draft
- [3] The BEACON is not a frame, it is a 20 bit long signal on the line which carries no information apart from its own presence. It is conceptually not different from IDLE signals which most physical layers use to retrieve clocking information from.

Cl 22 SC 22 P 31 L 13 # i-394

Kim, Yongbum

NIO

Comment Type TR Comment Status R MII

[CSD] CSD/Compatibility states "As a PHY amendment to IEEE Std802.3, the proposed project will use MII, and follow the existing format and structure of IEEE 802.3 protocol-independent specification of managed objects." It does NOT state that it will change MII and then use the modified version of MII. It states that this project will use MII. This project violates the stated compatibility statement. In addition, MII is widely used and deployed exposed interoperability interface, still with large installed base that is difficult to determine (installation spread over 10~15 years, starting 20+ years ago). One of the test whether an interface has been materially changed is by looking at the PICS in CL22.8.3 and there are 5 entries that changes the requirements to the installed base of MII.

*SuggestedRemedy*

Reverse all material changes to CL22 and make appropriate changes in other clauses of this project to make it work with CL22. If this cannot be done, then appropriate changes to the CSD/Compatibility with regard to CL22 be made and to be approved.

Response Response Status W

REJECT.

The CRG disagrees with the commenter. Functionality is specified using reserved codes at the MII to prevent any compatibility issue with compliant PHYs.

and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Cl 22 SC 22.2.2.5 P 31 L 49 # i-395

Kim, Yongbum

NIO

Comment Type TR Comment Status R MII

In "...with the exception of 10BASE-T1L (see 146.3.3.1) and 10BASE-T1S(see 147.3.2.1, Figure 147-4).", 10BASE-T1L is unnecessarily included as if 10BASE-T1L requires this change. It doesn't. TXER was added during 100 Mbps Ethernet projects, and some 10 Mbps system implementations being upgraded to 100 Mbps would experience buffer underruns, and wanted to have an option to signal to the PHY to corrupt the FCS. 10 Mb/s system never had such considerations nor signal that corresponds to TXER. If TXER is asserted, then 10BASE-T1L merely maps to an error symbol.

There is no need to change CL22 from 10BASE-T1L, and having it included in this proposed revision to CL22 distracts from the fact that CL22 modification is entirely caused by CL148 PLCA RS.

*SuggestedRemedy*

Remove the text "10BASE-T1L (see 146.3.3.1) and ", and make appropriate changes to the 10BASE-T1L (CL146) to remove superfluous support of TXER.

(Note: the subjective "superfluous" is used because in modern (higher performance) systems as well as back in 10 Mbps systems, the need for FIFO underrun implementational error handling are not needed).

Response Response Status W

REJECT.

The CRG disagrees with the commenter. An exception has been added to clarify that the use of TX\_ER with 10BASE-T1L/S PHYs is not precluded and, in fact, references to the behavior of these new PHYs with TX\_ER are provided.

Cl 148 SC 148.2 P 214 L 44 # i-396

Kim, Yongbum

NIO

Comment Type TR Comment Status X PLCA\_ID

[CSD] PLCA RS requires 1) each node/PHY to be configured with a nodeID, 2) entire network node/PHY configuration to be coordinated, i.e. unique and nearly sequential nodeID values, unique node with nodeID=0, etc 3) provides no protocol with which #2 could be accomplished, i.e. no interoperable protocol to achieve these requirements, 4) provides no remedy for boundary conditions such as multiple nodeID=0, no node with nodeID=0, non-unique nodeID in a network, unconfigured node in a configured network, etc, 5) provides no protocol that may discover any of these issues.

CSD/Compatibility means that two or more complaint implementations would interoperate with a high degree of probability. This is one of the main reasons most standards to exist -- assured and certain interoperability.

PLCA RS in CL148 does not meet this CSD requirements, nor its asserted claim in its CSD response.

*SuggestedRemedy*

CSD/Compatibility assertions with regard to CL148 PLCA operation is grossly incorrect. Appropriate changes to the CSD/Compatibility with regards to PLCA's inability to assure two compliant implementations interoperate without further engineering, design, and configuration be addressed, OR add appropriate specifications to remedy the concerns WRT interoperability and completeness of specification that assure interoperability, OR delete CL148 PLCA from this draft (and re-start the project development with completeness as a required scope, if desired.)

Proposed Response Response Status W

PROPOSED REJECT.

Commenter improperly refers to CSDs which are not in scope for a Standards Association Ballot.

Besides, the commenter is technically incorrect in his assertions:

- [1] PLCA node IDs do not need to be sequential
- [2] the definition of a protocol for assigning node IDs would be out of the scope of this project and the approved PAR.
- [3] PLCA is an optional feature that still operates under misconfiguration. See [http://www.ieee802.org/3/cg/public/Sept2018/beruto\\_3cg\\_mixing\\_PLCA\\_with\\_non\\_PLCA\\_enabled\\_nodes\\_r1.2.pdf](http://www.ieee802.org/3/cg/public/Sept2018/beruto_3cg_mixing_PLCA_with_non_PLCA_enabled_nodes_r1.2.pdf)

nd Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Cl 148 SC 148.2 P 214 L 44 # i-397

Kim, Yongbum

NIO

Comment Type TR Comment Status X PLCA\_ID

[CSD/Compatibility + PAR] CL148 PLCA RS does not specify how a node is selected for NodeID=0, how other NodeIDs are assigned, how an end-station is aware of other end-stations configuration enough to configure itself to operate, etc, such that two implementations connected via a referenced network segment is not assured to work. This indicates grossly incomplete specification.

SuggestedRemedy

Complete CL148 specification by including additional currently-missing specifications on how all parameters necessary to assure interoperability is achieved via non-vendor-dependant protocols. Since this is a concern WRT to missing specification, the suggested remedy is not included (i.e. filling in the missing specification is the scope of the IEEE 802.3cg project).

Proposed Response Response Status W

PROPOSED REJECT.

Description or requirements of assignment of parameters in the management entity is beyond the scope of this standard.

This is clearly stated in 148.2: "Other than the condition that the assigned node ID must be unique to the local collision domain, the method of determination of the node ID and to\_timer by the management entity is beyond the scope of this standard."

Additionally, commenter is incorrect. End stations on mis-configured networks or networks where not all the nodes are configured for PLCA operation will operate, allowing configuration to be set by management for improved performance. See [http://www.ieee802.org/3/cg/public/Sept2018/beruto\\_3cg\\_mixing\\_PLCA\\_with\\_non\\_PLCA\\_enabled\\_nodes\\_r1.2.pdf](http://www.ieee802.org/3/cg/public/Sept2018/beruto_3cg_mixing_PLCA_with_non_PLCA_enabled_nodes_r1.2.pdf)

Kim, Yongbum NIO  
 Comment Type TR Comment Status R PLCA

aPLCABurstTimer measure bit times inside the internal process where the entire packet is transferred atomically. This is entirely (externally) invisible parameter, meaning any number of bit-times an implementation uses, it is indistinguishable from other MAC transmit scheduling; therefore meaningless. IPG is generated by PLS/RS. The default value of 128 \*may be\* relevant if this timer is measuring the gap at the PCS. But at RS, this timer is meaningless.

*SuggestedRemedy*

Delete this timer.

Response Response Status W

REJECT.

The CRG disagrees with the commenter. The RS interfaces to the MAC layer via the PLS primitives and to the PHY via the MII interface. The RS groups and aligns the bits conveyed by the MAC via the PLS\_DATA.request primitive to the MII TX\_CLK (See 22.2.1.1 and 22.2.1.1.3). This mapping clarifies the specification of bit times within an RS. (see also 148.4.3.1)

Cl 30 SC 30.3.9.2.6 P 39 L 36 # i-400

Kim, Yongbum NIO  
 Comment Type TR Comment Status R PLCA

Capability for aPLCAMaxBurstCount set to 255 packet bursts would significantly impact fairness ("multiple-access") and would cause upper layer protocol time-outs.

*SuggestedRemedy*

Reduce the burst down to maximum size frame worth of packet packing (which I believe is not possible in current MAC services model), or some reasonable length such as 2 x max size frame (which I believe is achievable), or demonstrate the max range still provides fairness and provide confidence that properly (in-range value) configured nodes in a given network would not cause upper layer protocol time-outs.

Response Response Status U

REJECT.

The CRG disagrees with the commenter. The comment regarding upper layer protocols is protocol specific, which is outside the scope of IEEE 802.3.

The commenter did not provide a proposed resolution in sufficient detail to readily determine the specific wording of changes that will cause him to change his vote to approve (see SASB Ops Manual clause 5.4.3.2,b).

NIO

Comment Type TR Comment Status R PLCA

The concern is where entire function of PLCA resides. Is it just in RS (CL148)? Or is there PLCA mandatory components in PCS and/or PMA? This specification indicates that [optional] PLCA RS resides in PCA and PMA, requiring features otherwise not required for non-PLCA implementations.

10BASE-T1S PCS contains PLCA components that are optional. This is entirely inconsistent with PLCA is a optional function in RS layer. It looks to be that PLCA is also an optional function in PCS layer. If this is the case, the standard should state this. And if the PLCA is also an optional function in PMA layer, it should also be stated as such.

*SuggestedRemedy*

Either delete this PLCA Support in PCS/PMA and other PCS/PMA clauses, or clarify which layer(s), the optional PLCA function resides\, besides stated CL148 RS.

Response Response Status W

REJECT.

The CRG disagrees with the commenter. The referenced text is purely a detection that the transmitted signal is not corrupted and is entirely in Clause 147 PCS/PMA and does not represent PLCA function. It is not strictly PLCA support, and is not PLCA function. It may be useful for a variety of debugging purposes, including, but not limited to, when the clause 148 PLCA is used.

Kim, Yongbum

NIO

Comment Type TR Comment Status R Modes

Chater and scope of this PHY clause and CSD concern.

This clause has three separate PHYs that should not be considered as one PHY with two options.

1. Full-Duplex P2P PHY: Performs echo cancellation, full-duplex over one transmission line. This is an optional PHY in CL147.

2. Half-Duplex P2P PHY: Traditionally used with multi-port CL9 repeaters, this allows exactly two node network (one link, two link partners) and only such network, because the Clause 9 repeater is not supported as per proposed text in CL9. This is not a network. Two and only two node connection is a dedicated link. This is only mandatory PHY operation in CL147.

3. Half-Duplex Shared Medium PHY: Does NOT perform echo cancellation, half-duplex over shared medium. This is an optional PHY in CL147.

And the text says #1 and #3 are NOT interoperable -- CL147.1 says "...there are two mutually exclusive optional operating modes...".

The only mandatory PHY (Half-Duplex P2P) is useless. Two other PHYs are optional, but they are not optional to each other (mutually exclusive), yet all three PHYs are referred to as type 10BASE-T1S.

This clause organization is grossly in error. Each distinct PHY should has its own type designation (possibly its own clause, but only for clarity), #2 Half-duplex P2P PHY should be deleted for the stated reason of not being useful as a 'network'.

*SuggestedRemedy*

Pick the one PHY that meets CSD and objectives as written, or split this clause into at least two (one for P2P and one for Shared medium) separate PHY clauses and re-state the respective CSD as appropriate.

Response Response Status W

REJECT.

CRG disagrees with the commenter. The clause contains one PHY with three modes, with a common-denominator for interoperability. CRG disagrees with the commenter on interest in the mandatory mode of operation (half-duplex point-to-point). There are multiple methods of inter-linking point-to-point half-duplex segments, without the use of clause 9 repeaters using multiple topologies of choice, allowing larger networks (with more than 2 stations). A bridge is considered to be an element in common networks.

Comment Type TR Comment Status D PCS

[CSD/Compatibility] [Collision Detect, no assurance thereof]

In IEEE 802.3 project where CSMA/CD ("half-duplex") is supported, the collision detection method always has been specified, AND the assurance of 100% collision detection has been obvious, i.e. DC bias voltage rise from two or more transmitters using current source into a known resistance, or simple logical AND function of PMA TXD enable and RXD enable. This project, however, does not specify any collision detection method except to say 1) data corruption == collision, and 2) require, without specification, find two or more stations transmitting somewhere in the network and assert CRS during that time.

We all know what collision condition is, 'two or more simultanous transmission into a shared collision domain" or there about. It is the responsibility of the project to specify how this is done, and also assure us that collision detection confidence is at least ar PAR with prior projects. This project does not specify the collsion detection method; therefore, it is incomplete.

That said, there are tactical issues with the current draft, and I do not wish to indicate that fixing any of these tactical issues would be satisfactory to requiring 100% assurance of collision detect. But here goes.

1) "corrupted signal while transmitting" == collision. This has an obvious flaw that one station may see random bit-error (e.g. from a local noise hit) and detect collision and backs-off, the other station does not see a collision 'corrupted signal while tranmitting" and completes transmission. Some receivers may see errored frames, some may not see errored frame. Result = non-deterministic behavior and lost packet.

2) Local strong TX and remote weak TX may not assure corruption.

- Max Attenuation: Attenuation of the TX signal on the nominal-length worst-case channel is 65% (3.7 db)

- Max TX power of local, so +20% P-P from 147.5.4.1 transmit output voltage is 1V +/- 20% P-P. + minimum droop and power spectral density (highest power allowed).

- Min TX power of remote, so -20% P-P, with max droop.

so power diff give another ~66%. Or ~43% max interference from remote, and it could be as little as ~35% considering droop.

In addition, COL assertion within 256 bit times from the begining of a transmission seems insufficient -- a minimum collision duration is 96 bit times. A min collision + IPG would allow a new transmission to occur at 192 bit times from the initial collision. So allowing collisoin to assert up to 256 bit time later, would potentially affect the subsequent packet transmission.

Without receiver specification we have NO CLUE how receiver would behave -- whether or not data corruption would be detected from the worst case remote TX interference.. And we've opted for TX and channel spec and leave RX to implementors to \*recover\* tx data over channel.

From 147.3.5 Collision Detection:

"When operating in half-duplex mode, the 10BASE-T1S PHY shall detect when a

## and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

transmission initiated locally results in a corrupted signal at the MDI as a collision. When collisions are detected, the PHY shall assert the signal COL on the MII for the duration of the collision or until TX\_EN signal is FALSE. The method for detecting a collision is implementation dependent but the following requirements have to be fulfilled. .... a) The PHY shall assert COL within 256 bit times from the beginning of a transmission when one or more stations are transmitting at the same time.  
b) The PHY shall assert CRS in the presence of a signal resulting from a collision between two or more stations."

### *Suggested Remedy*

The draft is incomplete without 100% collision detection specification. 100% defined to be as obvious as prior 802.3 CSMA/CD PHY projects. Please complete the draft by including collision detection specification.

### *Proposed Response*      *Response Status*    **W**

PROPOSED ACCEPT IN PRINCIPLE.

Comment appears to comment on multiple issues.

1. With regards to the 256 bit times delay in asserting COL, at 184/35-37 change this:

====

The PHY shall assert COL within 256 bit times from the beginning of a transmission when one or more stations are transmitting at the same time.

====

to this:

====

The PHY shall assert COL when one or more stations are transmitting at the same time.

====

effectively removing "within 256 bit times from the beginning of a transmission".

This proposed resolution to comment #-i-45 clarifies the possible misinterpretation of this requirement.

2. CRG disagrees with the rest of commenter's statements.

Analysis has been presented (see

[http://www.ieee802.org/3/cg/public/adhoc/beruto\\_3cg\\_collision\\_detection.pdf](http://www.ieee802.org/3/cg/public/adhoc/beruto_3cg_collision_detection.pdf)) to address issues of existence, feasibility and reliability of collision detect (CD).

The highlights of this analysis relevant to this comment are:

- Target level of reliability (less-than-or-equal-to one miss-categorization per lifetime of universe) can be achieved based on the current specs.
- In the analogue domain, in presence of the specified Gaussian noise, reliable CD can be achieved. The commenter's calculation seems to confirm most of these (see commenter's figure compared to pages 4 and 5 of the study), but CRG has difficulty following commenter's calculations in full.
- Using the properties of the DME, the self-synchronizing scrambler and network geometry (reach, exclusion of the repeaters) and other properties of the Ethernet frame, the same can be achieved.
- At least one implementation exists that meet these requirements in specified noise environment.

Comment Type TR Comment Status D PLCA\_SCOPE

[CSD/Compatibility] [Installed base compatibility] [PAR -- scope did not include MAC function in the project scope]  
 In PLCA data state diagram, COLLIDE state and related functional behaviors create a condition where in half-duplex, CSMA/CD, MAC transmits a packet, into a substantially busy network, but the collision condition does not result in a collision on the shared media. The collision signal is asserted only for the local node for the TX to collide-&-retry, while the simultaneous received signal that caused the collision is expected to be received as if there is no collision. The remote transmitter is not notified of contention on the network. This is a new behavior for an half-duplex MAC.

Legacy and installed base of Ethernet MACs expect to operate in 'architecturally' separate TX and RX, i.e. full-duplex datapath, while in half-duplex mode. Explicit allowance for implementations to optimize the datapath resources to only support simplex datapath operation is found in 4.1.2 where only obvious externally testable condition was inserted into the CL4 spec:

"4.1.2 CSMA/CD operation. .... Transmit frame operations are independent from the receive frame operations. A transmitted frame addressed to the originating station will be received and passed to the MAC client at that station. This characteristic of the MAC sublayer may be implemented by functionality within the MAC sublayer or full duplex characteristics of portions of the lower layers."

And the clear architectural model vs implementations here in 1.1.3.1: "...The architectural model is based on a set of interfaces that may be different from those emphasized in implementations. One critical aspect of the design, however, shall be addressed largely in terms of the implementation interfaces: compatibility."

This new behavior specified in CL148 PLCA data state diagram is not compatible with many installed bases of 802.3 nodes with appropriate exposed MII interoperability test point that is also a physical interface with specified connectors. Also as forementioned, the contention management and collision handling are MAC functions, not a part of Physical Layer that Reconsiation Sub-layer belongs to.

Additional info could be found here : (slides 14~18 of):  
[http://www.ieee802.org/3/cg/public/Nov2018/Kim\\_3cg\\_01a\\_1118.pdf](http://www.ieee802.org/3/cg/public/Nov2018/Kim_3cg_01a_1118.pdf)

*SuggestedRemedy*

This clause CL148 PLCA RS should be deleted. Alternatively re-architected to avoid introducing new normative behaviors to the installed base with exposed interoperability interfaces.

Proposed Response Response Status W

PROPOSED REJECT.

Commenter fails to show compatibility issues with conformant implementations and incorrectly posits PLCA is a new MAC.

MICK SEAMAN

Comment Type G Comment Status D PLCA\_PRIORITIES

The utility of PLCA would be considerably improved, and emerging application areas (e.g. industrial, automotive) if the BEACON mechanisms provided simple support for priority. Two priority levels would be sufficient to support a deterministic (known bounded latency) service in addition to best effort. Four priority levels may be desirable, though I would not advocate more without detail uses case analysis.

*SuggestedRemedy*

Specify the BEACON to allow inclusion of a priority indication as a follow on project if not part of the present effort.

Proposed Response Response Status W

PROPOSED REJECT.  
 Big Ticket Item - PLCA\_PRIORITIES.

Communication of 802.1 priorities to the physical layer in an 802.3 PHY would require modification of the 802.3 MAC Service Access Point definition, and hence the MAC layer. While potentially desirable, this would be outside the scope of a physical layer project and the approved PAR.

Comment Type E Comment Status A Editorial

Not sure why the variable to represent the RX\_DV signal of the MII is named pcs\_rxdv, RX\_ER is named pcs\_rxer and RXD named pcs\_rxd in the PCS Receive state diagram, particularly when the Figure 147-10 'Heartbeat transmit state diagram' uses COL for the MII signal COL, CRS for CRS and RX\_DV for RX\_DV.

SuggestedRemedy

Suggest that in Figure 147-7 and 147-8:

- [1] pcs\_rxdv is renamed RX\_DV.
- [2] pcs\_rxer is renamed RX\_ER.
- [2] pcs\_rxd is renamed RXD.

Response Response Status C

ACCEPT IN PRINCIPLE.

Multiple editorial changes are required in both the PCS Receive and PCS Transmit functions subclauses to address the lack of clarity pointed out by the commenter.

Editorial license to align other comments with the variable name changes in this comment response, and to re-alphabetize variable names in lists as necessary.

Throughout the whole subclause 147.3.2 (including figures) apply the following changes:

- replace all occurrences of "pcs\_txen" with "TX\_EN"
- replace all occurrences of "pcs\_txer" with "TX\_ER"
- replace all occurrences of "pcs\_txd" with "TXD"

Throughout the whole subclause 147.3.3 (including figures) apply the following changes:

- replace all occurrences of "pcs\_rxdv" with "RX\_DV"
- replace all occurrences of "pcs\_rxer" with "RX\_ER"
- replace all occurrences of "pcs\_rxd" with "RXD"

At page 170, line 42 replace "with every PCS transmit clock cycle" to "with every symb\_timer expiration. The symb\_timer is defined in 147.3.2.7."

At page 177, line 33 change the description of the "tx\_sym" variable to: "5B symbol to be conveyed to the PMA Transmit function by the means of the PMA\_UNITDATA.request primitive specified in 147.2.2."

At page 178, line 24 change the description of the "ENCODE" function to: "This function takes a 4 bit input parameter Scn<3:0> and returns a 5B symbol according to the following procedure:  
1. Convert Scn<3:0> into Sdn<3:0> as specified in 147.3.2.6.  
2. Convert Sdn<3:0> (4B symbol) into the corresponding 5B symbol defined in Table 147-1."

## and Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

At page 179, line 24 change the description of the "STD" abbreviation to:  
"Alias for symbol timer done."

At page 179, line 32, change the second paragraph (starting with "An implementation of ...") to read:

"An implementation of a self-synchronizing scrambler by a linear-feedback shift register is shown in Figure 147-6. The bits stored in the shift register delay line at time  $n$  are denoted by  $Scn<16:0>$ . The '+' symbol denotes the exclusive OR logical operation. When  $Scn<3:0>$  is presented at the input of the scrambler,  $Sdn<3:0>$  is produced by shifting in each bit of  $Scn<3:0>$  as  $Scn<i>$ , with  $i$  ranging from 0 to 3 (i.e., LSB first). The scrambler is reset upon execution of the PCS Reset function. If the PCS Reset is executed, all bits of the 17-bit vector representing the self-synchronizing scrambler state are arbitrarily set. The initialization of the scrambler state is left to the implementer. In no case shall the scrambler state be initialized to all zeroes. At every STD, if no data is presented at the scrambler input via  $Scn<3:0>$ , the scrambler may be fed with arbitrary inputs."

At page 180, line 8, append the following text to subclause 147.3.2.7:

"symb\_timer

A continuous free-running timer. PMA\_UNITDATA.request messages are issued by the PCS concurrently with symb\_timer\_done (see 147.2.2). TX\_CLK (see 22.2.2.1) shall be generated from 5B\_symb\_timer with the rising edge of TX\_TCLK generated synchronously with 5B\_symb\_timer\_done.

Continuous timer: The condition symb\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration.

Duration: 400 ns  $\pm$  100 ppm (see 22.2.2.1)"

At page 179 in Figure 147-6 perform the following changes:

- replace "TXDn[i]" with "Scn<i>". Please note the 'n' is a subscript
- replace all square brackets '[' with angular brackets '<>'

At page 180, line 9, change the description of the "RXn" variable to read:

"The rx\_sym parameter of the PMA\_UNITADATA.indication primitive defined in 147.2.1. The 'n' subscript denotes the rx\_sym conveyed in the most recent recv\_symb\_conv\_timer cycle.

The 'n-x' subscript indicates the rx\_sym conveyed 'x' cycles behind the most recent one."

At page 181, line 18, change the description of the "DECODE" function to read:

"This function takes a 5B symbol input parameter and returns a 4 bit value Dcn<3:0> value according to the following procedure:

1. Convert the 5B input symbol into Drn<3:0> by performing a reverse lookup of Table 147-1. If no 4B value is associated to the given 5B symbol, the PCS Receive function shall assert RX\_ER for at least one symbol period and Drn<3:0> may be set arbitrarily.
2. Convert Drn<3:0> to Dcn<3:0> as specified in 147.3.3.7."

Please not that the 'n' in the Dcn and Drn variables name is a subscript.

At page 181, line 26, change the description of the "RSCD" abbreviation to read:

"Alias for recv\_symb\_conv\_timer\_done."

At page 183, line 48, insert a new subclause 147.3.3.x with name "Timers" between

existing subclauses 147.3.3.7 and 147.3.3.8.

Add the following text to the newly created subclause:

"recv\_symb\_conv\_timer

A continuous timer which expires when the PMA\_UNITDATA.indication message is generated (see 147.2.1).

Continuous timer: The condition recv\_symb\_conv\_timer\_done becomes true upon timer expiration.

Restart time: Immediately after expiration.

Duration: timed by the PMA\_UNITDATA.indication message generation."

Perform renumbering of the subclauses accordingly.

At page 183, line 28 change the whole paragraph starting with "The PCS receive function shall ..." to read:

"The PCS Receive function descrambles the 5B/4B decoded data stream and returns the value of RXD<3:0> to the MII. The descrambler shall employ the polynomial defined in 147.3.2.6. The implementation of the self-synchronizing descrambler by linear-feedback shift register is shown in Figure 147-9. The bits stored in the shift register delay line at time  $n$  are denoted by Dcn<16:0>. The '+' symbol denotes the exclusive OR logical operation.

When Drn<3:0> is presented at the input of the descrambler, Dcn<3:0> is produced by shifting in each bit of Drn<3:0> as Drn<i>, with  $i$  ranging from 0 to 3 (i.e., LSB first). The descrambler is reset upon execution of the PCS Reset function. If PCS Reset is executed, all the bits of the 17-bit vector representing the self-synchronizing descrambler state are arbitrarily set. The initialization of the descrambler state is left to the implementer. At every RSCD, if no data is presented at the descrambler input via Drn<3:0>, the descrambler may be fed with arbitrary inputs."

Please not that the 'n' in the Dcn and Drn variables name is a subscript.

At page 183, in figure 147-9, perform the following changes:

- replace "RXDn[i]" with "DCn[i]"
- replace all square brackets '[' with angular brackets '<>'

At page 191, line 52, add the followint text after "DME encoded stream received at the MDI.":

"The clock recovery provides a synchronous clock for sampling the signal on the pair. While it may not drive the MII directly, the clock recovery function is the underlying source of RX\_CLK."

Comment Type T Comment Status A PLCA\_LIMITS

The existing draft allows configuration of compliant implementations in a way that violates a rule of CSMA/CD physical layer design - that the delay in the physical layer should not be allowed to be so long that late collisions can occur. The variable delay line length is allowed to be up to to\_timer \* plca\_node\_count + beacon\_timer. The delay line should be limited to less than the slotTime in order to avoid late collisions.

SuggestedRemedy

Change from:  
The variable delay line is a small buffer that aligns a transmission with the transmit opportunity. The variable delay line length is no greater than to\_timer \* plca\_node\_count + beacon\_timer.

To:  
The variable delay line is a small buffer that aligns a transmission with the transmit opportunity. The variable delay line length shall be less than slotTime.

Response Response Status C

ACCEPT IN PRINCIPLE.  
Change 148.4.6.1 page 225 In 33-34 from:  
The variable delay line is a small buffer that aligns a transmission with the transmit opportunity. The variable delay line length is no greater than to\_timer \* plca\_node\_count + beacon\_timer.  
To:  
The variable delay line is a small buffer that aligns a transmission with the transmit opportunity.

In Figure 148-4, page 226, In 49-50, in the transition from the HOLD state to the A connector, change the condition to:  
"recv\_timer\_done + receiving + (a ≥ delay\_line\_length)"

- In Figure 148-4, page 227, In 7-16 do the following:
1. remove the transition from the COLLIDE to the PENDING STATE and its associated condition
  2. In Figure 148-4, add a new state DELAY\_PENDING between COLLIDE and PENDING states.
  3. Add a transition between COLLIDE and DELAY\_PENDING states with the following condition: "!plca\_txen"
  4. Add a transition between DELAY\_PENDING and PENDING states with the following condition: "pending\_timer\_done"
  5. Add the following text inside the DELAY\_PENDING state box:  
"start pending\_timer  
SIGNAL\_STATUS <= NO\_SIGNAL\_ERROR"
  6. From the PENDING state delete "CARRIER\_STATUS <= CARRIER\_ON" and "SIGNAL\_STATUS <= NO\_SIGNAL\_ERROR"

## PLCA Management Parameters for 10 Mb/s Operation and Associated Power Delivery over a Single Balance

Grant editorial license to draw the diagram according to IEEE 802.3 style

Change in 148.4.6.1, page 225 In 43-46:

During the COLLIDE state, the PLCA Data state diagram asserts packetPending = FALSE and CARRIER\_STATUS = CARRIER\_ON via the PLS\_CARRIER.indication primitive.

When the MAC is done sending the jam bits as described in Clause 4, it waits for the next transmit opportunity by switching to PENDING state.

To:

During the COLLIDE state, packetPending = FALSE and CARRIER\_STATUS = CARRIER\_ON are asserted via the PLS\_CARRIER.indication primitive. When the MAC is done sending the jam bits as described in Clause 4, it waits for the next transmit opportunity by switching to DELAY\_PENDING state. The PLCA Data State Diagram transitions to the PENDING state after waiting for the pending\_timer. The pending\_timer is used to prevent committing to a transmit opportunity before transmit data is available. This prevents conveying unwanted long COMMIT requests to the PHY.

Comment Type T Comment Status A PLCA\_LIMITS

Even when the variable delay line length is less than slotTime, it is possible to configure a node to overrun the delay line before a transmit opportunity arrives. For example, if to\_timer is set to 255 and there are more than 2 nodes, the delay line can fill before the transmit opportunity arrives. Other combinations of settings can lead to the same error.

*SuggestedRemedy*

Add to the B exist condition of the HOLD state of Figure 148-4, a check to exit if the variable delay line is full. The delay line will be emptied by the action of the state diagram, and the node will transmit into a subsequent transmit opportunity. Flag the error condition in Clause 30.
