Comment Type T Comment Status D

SNR operating margin as currently proposed in the draft is essentially an 8 bit value (255 used values), but it is defined as a 16bit register with 0x8000 as zero dB reference. This is very inefficient as all 16 bits would be toggling between values 0.0dB and -0.1dB.

SuggestedRemedy

Represent the 8-bit SNR margin in bits 7:0 of register 2314, with 0x80 as zero reference for that field

Proposed Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

TFTD

It may be desirable to keep a 16-bit register to be consistent with other Clauses.

SNR

286

How is SNR operating margin defined? We currently don't have a pre-FEC (raw) BER target in the spec. The BER < 1e-12 is post-FEC. So what does 0dB mean here?

SuggestedRemedy

I see three possible solutions here:

- a) Define a pre-FEC BER target, which will implicitly set a reference SNR level for the SNR margin
- b) Define a fixed reference SNR pre-FEC
- c) Report the actual SNR pre-FEC and don't talk about 'margin'. In the latter case the SNR register value becomes strictly positive.

Proposed Response

Response Status W

PROPOSED REJECT.

Margin is relative to an implementation-dependent number determined by the implementer. It doesn't need to be defined in the standard to be meaningful.

OAM

OAM status message.

It is not clear whether registers 3.2319 and 3.2319 shouldbe R/W or RO.

Referring to page 117 (159.3.8.2.12)

I think 3.2318.7:2,0 and 3.2319 should be RO since the status is from somewhere else.

3.2318.1 should be R/W since the user will go in to make a request to clear.

Is the intent that these registers are automatic, or is the expectation that the user has to manually write in all these statuses?

SuggestedRemedy

If the intent is these registers are automatic then

3.2318 and 3.2319 should all be changed to RO with the exception of 3.2318.1.

Also the footnote should be changed to include RO.

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

TFTD

If these are made RO we must clearly define how the PHY sets and clears each bit. We wanted to keep these definitions flexible for the PHY vendors to chose the implementation.

Comment Status D Comment Type T

Registers

The spec text "detecting a BER of > 4e-4" is ambiguous, because actually the frame errors are counted here, not bit errors. Furthermore this number seems way too high. Bit errors at PMA level will mostly be successfully corrected by the RS-FEC, or corrupt a whole RS frame. Counting the number of erroneous RS frames seems the correct approach, but why would we express this as BER instead of RFER? Note that the RFER counter is only 6 bits so apparently this not supposed to happen very often. For a RFER<1e-9 the packet level performance is similar to a transmission scheme without RS-FEC and a PMA BER of about 3e-11.

SuggestedRemedy

Propose to change into: "detecting a RFER > 1e-9

SuggestedRemedy

Change: The Link Synchronization function is used when Auto-Negotiation is disabled to synchronize between the ...

To: The Link Synchronization function is used when Auto-Negotiation is disabled, to synchronize between the ...

Proposed Response

Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Repeating that "link synchronization" is to "synchronize" has no value, and actually isn't what this function does. It doesn't control the link_status timer (that's maxwait_timer in the phy control diagram) - also the case where autoneg is not implemented is left out.

Combine the first and second sentences of 149.1.3.4 as follows:

Replace: The Link Synchronization function is used when Auto-Negotiation is disabled to synchronize between the MASTER PHY and SLAVE PHY before training starts. Link Synchronization provides a fast and reliable mechanism for link partners to detect the presence of each other and start the timers used by the link monitor which determines link status.

With: The Link Synchronization function is used when Auto-Negotiation is disabled or not implemented to detect the presence of the link partner, time and control link failure, and act as the data source for the PHY control state diagram.

C/ 149 SC 149.2.2 P80 L3 # 276 McClellan, Brett Marvell

I believe this editor's note refers to a special GMII codeword defined and used in Clause 97

Comment Type Т Comment Status D State diagrams Comment Type

C/ 149

Comment Status D We removed SEND I. but didn't change the number of values to "three" from "four" in the

only for the purpose of signaling PMA PHYREADY indication (loc phy ready) to the link partner. For Clause 97, Idle was split into two different codewords, one for loc phy ready = NOT OK and one for loc phy ready = OK.

This points out a problem in the current CH draft.

149.2.2.8 PMA PHYREADY indication definition states that "loc phy ready is conveyed to the link partner by the PCS as defined in 149.4.4.1."

149.4.4.1 then points back to Table 149-1. "This variable is conveyed to the link partner by the PCS as defined in Table 149-1."

However, Table 149-1 has no codeword to convey loc phy ready, loc phy ready was created in BP to prevent either side from transmitting frames until both sides are ready. loc phy ready is unnecessary for XGMII based PHYs and currently it isn't used in the PMA PHY control state machine. Normal ordered sets of Local Fault and Remote Fault from the Reconciliation Sublaver perform the function of holding off frames until both PHYs are ready.

SuggestedRemedy

Remove the editor's note.

Remove the primitive PMA PHYREADY.indication and any text and figure references related to loc phy ready.

Remove the primitive PMA REMPHYREADY request and any text and figure references related to rem phy ready.

Remove loc phy ready definition from 149.4.4.1 State diagram variables.

Remove rem phy ready definition from 149.4.4.1 State diagram variables.

Data are processed in units of superframes.

It makes no sense if the 8 RS-FEC partially fill the final superframe.

A related issue is once the LP_IDLE is sent, the transmitter is committed to sending the complete sleep signal (8 RS-FEC frames worth) and not abort early.

Add the sentences below to clarify how the 8 RS-FEC frames of LP_IDLE are packed at the end of line 23.

SuggestedRemedy

The 8 RS-FEC frames of LP_IDLE completely fill two superframes in L=4 interleave or four superframes in L=2 interleave. Once initiated, the complete sleep signal consisting of 8 RS-FEC frames of LP_IDLE shall be transmitted.

Proposed Response Response Status W

We space alerts so they do not overlap by forcing their start times. It is more clear to refer to alert start time as opposed to alert signal. Also in the same sentence we refert to the link partner. See following text and changes in bold on the right

lpi_offset is a fixed value equal to lpi_qr_time / 2 + 4 (52 RS-FEC frame periods) that is used to ensure refresh signals and alert signals are appropriately offset by the link partner's.

SuggestedRemedy

lpi_offset is a fixed value equal to lpi_qr_time / 2 + 4 (52 RS-FEC frame periods) that is used to ensure refresh signals and alert start times are appropriately offset from the link partner's.

Proposed Response Response Status W
PROPOSED ACCEPT IN PRINCIPLE.

Change "alert signals" to "alert start times" on P100 L34.

C/ 149 SC 149.3.5.1 P101 L4 # 65
Lo. William Axonne Inc.

Comment Type TR Comment Status D

EEE

The method to synchronize the master as slave as described in this section defeats the entire purpose of partial frame count during training as shown in Figure 149-12 and introduces uncertainity in the timing.

SuggestedRemedy

Delete:

The transition to PCS_Test is used as a fixed timing reference for the link partners. Refresh signaling is derived by counting RS-FEC frames from the transition to PCS_Test. At the Master RS-FEC frame count of zero and all multiples of 96 RS-FEC frames thereafter denote the start of the cycle.

Replace with:

Refresh signaling is derived by tracking the partial frame count as shown in Figure 149-12.

Delete (lines 16, 17):

Following the transition to PAM4, the PCS continues to count transmitted RS-FEC frames (tx_rsfc), and uses the counter to generate refresh, ALERT, and wake control signals for the transmit functions.

Replace with:

Following the transition to PAM4, the PCS continues to count partial frames and uses the count to generate refresh, ALERT, and wake control signals for the transmit functions.

Proposed Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Delete all text in Clause 149.3.5.1.

Editorial license to format correctly.

Replace with: To maximize power savings, maintain link integrity, and ensure interoperability, EEE-capable PHYs must synchronize refresh intervals during the LPI mode. An EEE-capable PHY in SLAVE mode is responsible for synchronizing its Partial PHY frame Count (PFC24) to the MASTER's PFC24 during PAM2 training. For 10GBASE-T1, 5GBASE-T1, and 2.5GBASE-T1 the SLAVE's PFC24 should be +0/-4, +0/-2, and +0/-1 partial frames respectively with respect to the MASTER's PFC24.

Refresh signaling is derived by tracking the RS-FEC frame count as shown in Figure 149-12. where:

RS-FEC frame count = (PFC24 / 4) mod 96.

The start of the SLAVE quiet-refresh cycle is delayed from the MASTER by 52 RS-FEC frames. This offset ensures that the MASTER and SLAVE ALERT windows are offset from each other and that the refresh periods are close to half cycle offset.

Following the transition to PAM4, the PCS continues with the RS-FEC frame count and uses the count to generate refresh, ALERT, and wake control signals for the transmit functions.

Also resolves Comment #33.

Comment Type E Comment Status D EEE

Add commas for readability.

SuggestedRemedy

Change: At the Master RS-FEC frame count of zero and all multiples of 96 RS-FEC frames thereafter denote the start of the cycle.

To: At the Master, a RS-FEC frame count of zero, and all multiples of 96 RS-FEC frames thereafter, denote the start of the cycle.

Proposed Response

Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

In addition to adding the Figure, on P148 L 37 insert the following text, with editorial license:

The following variable is required only for PHYs that support the EEE capability: lpi refresh detect

Set TRUE when the receiver has reliably detected refresh signaling and FALSE otherwise. The exact criteria left to the implementer.

pcs data mode

Generated by the PMA PHY Control function and indicates whether or not the local PHY may transition its PCS state diagrams out of their initialization states. The current value of the pcs_data_mode is passed to the PCS via the PMA_PCSDATAMODE.indicate primitive. In the absence of the optional EEE and fast retrain capabilities, the PHY operates as if the value of this variable is TRUE.

Comment Type T

NXP Semiconductors

OAM

I understand the benefit of an separate RS code to protect OAM bytes during LPI mode. However it should be noted that EEE is optional. It doesn't make sense to me that the OAM data during normal operation would be double RS encoded as it is already protected by the regular RS-FEC frame. Therefore I propose to make the OAM RS optional for normal operation.

SuggestedRemedy

I propose to only use the (16,14,10) RS coding for OAM during refreshing and not during normal operation. At least this should not be mandated. During normal operation the OAM bytes are already protected by the RS(360.324.10) scheme. We intentionally selected an RS scheme where one byte was left over for OAM. A transceiver with EEE still can double RS encode the OAM all the time, but an PHY that does not support EEE should not be required to add this additional coding without any purpose. In order to keep it simple with a 16 byte scheme, the last two bytes will be reserved in normal operation, and be transmitted as zero.

Chen. Steven Broadcom

Comment Status D Comment Type TR late

Partially accept William Lo's commentary #66. Suggest additional improvement. Need to identify the OAM symbol based on the OAM framing bit.

SuggestedRemedy

At line 26, change "Parity Check(rx oam field<8:0>) = Even" to "(rx cnt !=16) * (rx oam field < 8 > = 0)".

At line 31, change "else" to "(rx cnt !=16) * (rx oam field<8> = 1)"

Proposed Response Response Status W

PROPOSED REJECT.

What you proposed will not work since the final 2 OAM symbols are 10-bit parity symbols and bit 8 can be either 1 or 0.

So we cannot rely on looking only at this bit by itself. That is why we defined frame boundary variable that looks at the sequence of all 16 rx oam field<8> with the final 2 bits being xx.

missing comma

SuggestedRemedy

Change: onto the MDI pulses modulated To: onto the MDI, pulses modulated

Proposed Response Status W

PROPOSED ACCEPT IN PRINCIPLE.

Sentence is punctuated, correctly, but is confusing - and is incorrect by not covering the autoneg case.

Change: PMA Transmit shall continuously transmit onto the MDI pulses modulated by the symbols given by tx_symb when sync_link_control = ENABLE, or the sync_tx_symb output by the PHY Link Synchronization function when sync_link_control = DISABLE, after processing with optional transmit filtering, digital-to-analog conversion (DAC) and subsequent analog filtering.

To: When the PHY control state diagram (Figure 149-31) is not in the DISABLE_TRANSMITTER state, PMA Transmit shall continuously transmit pulses modulated by the symbols given by tx_symb onto the MDI after processing with optional transmit filtering, digital-to-analog conversion (DAC), and subsequent analog filtering. During Link Synchronization, when sync_link_control = DISABLE and Auto-Negotiation is either not enabled or is not implemented, the sync_tx_symb output by the PHY Link Synchronization function shall be used in place of tx_symb as the data source for PMA Transmit.

Tu, Mike Broadcom

Comment Type T Comment Status D

1. For 1000BASE-T1, RFER = BER (<1e-10) * bits/RS-FEC (3600) < 3.6e-7. See 97.4.2.3.

- 2. For 10GBASE-T. LFER = BER (<1e-12) * bits/LDPC frame (3200) < 3.2e-9. See 55.4.2.4.
- 2. For 10GBASE-1, LFER = BER (<1e-12) "bits/LDPC frame (3200) < 3.2e-9. See 55.4.2.4
- 3. So it is reasonable for 802.3ch to set RFER = BER (<1e-12) * bits/RS-FEC (3200) < 3.2e-9.

SuggestedRemedy

Change "TBD" to "3.2 x 10^{-9}".

Add EEE Refresh monitor state diagram

SuggestedRemedy

Use same EEE Refresh monitor state diagram from 802.3bz (Figure 126-30)

Proposed Response Response Status W

PROPOSED ACCEPT IN PRINCIPLE

In addition to adding the Figure, on P148 L 55 insert the following text, with editorial license:

The following timer is required only for PHYs that support the EEE capability: lpi refresh rx timer

This timer is used to monitor link quality during the LPI receive mode. If the PHY does not reliably

detect reliable refresh signaling before this timer expires then a full retrain is performed. Values: The condition lpi refresh rx timer done becomes true upon timer expiration. Duration: This timer shall have a period equal to 50 complete quiet-refresh signal periods. equivalent to 1.536/S ms.
