Replace equation 149-26 (PSAACRF loss), with "PSAACR-F loss (f) >= min(75, 86- 20log10(f/100)) dB, 1<=f<=FMax (149-26)" (text already has f is the frequency in MHz)					We would like to suggest a way to use AN(Auto-negotiation) for asymmetric transmission Generally, traditional AN is self-configuring to use the highest speed that can be support by the common links between end devices. For asymmetric transmission, a new AN moo is proposed, which supports the lowest common link speed (or a specific link rate like 10 Mbps) between end devices. This can reduce the BER and increase the energy saving a the reliability of low-speed data. In order to add the new AN mode, providing either one of the uplink and downlink directions at a low speed in AN for asymmetric data transmission mode. And power saving in some cases while using AN. The LPI mode is a method for implementing EEE. However, when small data is periodically transmitted with a gap, the PHY repeatedly enters and leaves the LPI mode, resulting in energy loss. Also, the refresh signal in LPI mode only maintains a connection between the sender and the receiver, but does not transmit any data. In order to solve this frequent LPI transition problem, part of the unused OAM fields can be used to adjust the transmission speed depending on the change of data amount in buffers. If PHY transmit quiet time block after the our proposed OAM field, PHY can transmit PAM4 data block with information and operate various speeds. Therefore we propose OAM transmission for various speed transmission.

SugaestedRemedv

Our proposed solution uses the D9 bit field of the previously transmitted OAM frame (figure 149-17) to monitor the buffer accumulated in the PHY and adjust the transmission rate. When D9 = 0, this defines no change in the amount of data to be transmitted and the PHY transmits at the same rate at the next data transmission. When D9 = 1, this indicates that there is a change in the amount of data and that the PHY immediately transmits OAM symbol 0 after parity bit transmission. OAM symbol 0 is determined to configure the link speed at either 5 Gbps or 2.5 Gbps speed on 10 Gbps link based on the bit combinations of D4 and D5.

1. <D4. D5> = <0. 0> 10 Gbps

2. <D4. D5> = <0. 1> 5 Gbps

3. <D4. D5> = <1. 0> 2.5 Gbps

In case of 5 Gbps, the link mode of PHY will be on the quiet time of 64 bits, which is equal in bit length one PAM4 data block. The quiet time is a time period with no data transmission.

In case of 2.5 Gbps, the link mode of PHY will be on the quiet time of 192 (64 x 3) bits. which is equal to one data block. And the length and frequency of quiet time and PAM4 data blocks are equal for both cases.

There is	no "PCS	Data" state. It	probably meant the	e "SEND DA	TA" state. However	

"PCS Data" might be a better name for this state.

SuggestedRemedy

Option 1. Replace this "PCS Data" by "SEND DATA" Option 2. Replace all "SEND DATA" and "SEND DATA" by "PCS Data" and "PCS DATA" respectively throughout D1.2

Response Response Status C

ACCEPT IN PRINCIPLE.

Replace "SEND*DATA" and "PCS Data" with "PCS DATA" in all locations. Make this consistent througout Clause 149 in all state diagrams and references to states.

In Figure 149-2, "pcs data mode" is missing

SuggestedRemedy

In Figure 149-2: 1. Add an arrowed line for "pcs data mode", coming out of the "PHY CONTROL" block, and going into the "PCS TRANSMIT" block. 2. If proposal in "tu 3ch 02 0419.pdf" to make pcs data mode available even without EEE is adopted, then make this a SOLID line. Otherwise make this a DASHED line. Response Status C

Response

ACCEPT IN PRINCIPLE.

Implement the propossed change with solid lines.

den Besten, Gerrit Comment Type T

Comment Status R

Link Segment

Maximum specified frequency for coupling attenuation has been adapted to Fmax, which make perfect sense for a single-speed transceiver. For multi-speed transceivers, it might not be desirable to mandate the need for frequency-scaling anti-aliasing filters in the design. In order to circumvent that and not overspecify channels generally, a good solution could be to require that the link segment shall meet the requirements of the highest supported rate at that port.

SuggestedRemedy

Insert after line 42:

For multi-speed transceivers the link segment shall meet the coupling attenuation requirements for highest supported rate on the MDI.

Response Response Status C

REJECT

IEEE802.3 does not specify implementation requirements or multi-speed PHYs.

Replace: 750 MHz --> 1000 MHz 70 dB for f<1000 MHz 70-20*log(f/1000) for 1000<f<Fmax Mhz

Response Status C

REJECT.

Response

The commenter may choose to provide a presentation at a future meeting or ad hoc with data to support this and may choose to submit a comment at WG ballot.

The group would like additional information on how BCI impacts this since it only tests to 400 MHz.

The group would like to see test data on multiple cables and connectors.
