Comment Type   **T**   *Comment Status* **R**   *EEE*

The latest asymmetric transmission proposals have following problems. 1. The EEE mode should be used for low speed transmission. 2. Even if data traffic at low speed have to increase, the data traffic should be transmitted only in a predetermined period. This may cause a buffer overflow. 3. There is a delay time when sleep mode is switched on. During this delay time, PHY can not cover the traffic coming from the MAC layer. In this situation, frame loss or collision problems can occur.

SuggestedRemedy

We would like to suggest a way to use AN(Auto-negotiation) for asymmetric transmission. Generally, traditional AN is self-configuring to use the highest speed that can be supported by the common links between end devices. For asymmetric transmission, a new AN mode is proposed, which supports the lowest common link speed (or a specific link rate like 10 Mbps) between end devices. This can reduce the BER and increase the energy saving and the reliability of low-speed data. In order to add the new AN mode, providing either one of the uplink and downlink directions at a low speed in AN for asymmetric data transmission mode. And power saving in some cases while using AN. Because the AN can exchange information with the MAC layer, the MAC measures the queue characteristics and frequency of use to determine the trigger for the asymmetric transmission and instructs the AN to set the asymmetric uplink / downlink rate. As the queue changes, it can be switched to a symmetric or asymmetric transmission, and this decision is made entirely by the MAC.

In reality there is a piece of the channel between the MDI connector and the transceiver which is not accounted for in link segment IL & RL. Although the IEEE PHYs set mandatory specs for the MDI reference point, which makes a lot of sense, I think it would be useful to add informative specs for IL and RL for the part of the channel behind the MDI. IMO, the assumptions for IL & RL for this module-internal channel part, used to define the spec, should be mentioned.

Kim, Taehyoung   Hanyang University and Hyundai Motor Company

Comment Type **T**   *Comment Status* **R**   *EEE*

The LPI mode is a method for implementing EEE. However, when small data is periodically transmitted with a gap, the PHY repeatedly enters and leaves the LPI mode, resulting in energy loss. Also, the refresh signal in LPI mode only maintains a connection between the sender and the receiver, but does not transmit any data. In order to solve this frequent LPI transition problem, part of the unused OAM fields can be used to adjust the transmission speed depending on the change of data amount in buffers. If PHY transmit quiet time block after the our proposed OAM field, PHY can transmit PAM4 data block with information and operate various speeds. Therefore we propose OAM transmission for various speed transmission.

SuggestedRemedy

Our proposed solution uses the D9 bit field of the previously transmitted OAM frame (figure 149-17) to monitor the buffer accumulated in the PHY and adjust the transmission rate. When D9 = 0, this defines no change in the amount of data to be transmitted and the PHY transmits at the same rate at the next data transmission. When D9 = 1, this indicates that there is a change in the amount of data and that the PHY immediately transmits OAM symbol 0 after parity bit transmission. OAM symbol 0 is determined to configure the link speed at either 5 Gbps or 2.5 Gbps speed on 10 Gbps link based on the bit combinations of D4 and D5.
1. <D4, D5> = <0, 0> 10 Gbps
2. <D4, D5> = <0, 1> 5 Gbps
3. <D4, D5> = <1, 0> 2.5 Gbps
In case of 5 Gbps, the link mode of PHY will be on the quiet time of 64 bits, which is equal in bit length one PAM4 data block. The quiet time is a time period with no data transmission.
In case of 2.5 Gbps, the link mode of PHY will be on the quiet time of 192 (64 x 3) bits, which is equal to one data block. And the length and frequency of quiet time and PAM4 data blocks are equal for both cases.

Response   *Response Status* **C**

REJECT.

This is a bunch of changes in many differnt sections that are related to partial frames. This is clarifying text, table, and figure that makes no technical changes other than one on slide 10.

See Lo_3ch_02_0419.pdf for all the justification and remedy.

SuggestedRemedy

Implement Lo_3ch_02_0419.pdf slides 3, 5, 7, 9, 10, 11, 12, 13

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Slide 3: No consensus to make the change.
Slide 5: P68, L32: Change "PAM2 training sequences" to "PAM2 training frames".
P96, L27 as proposed
P97, L1&2: Change "It obtains block lock to the PHY frames during the PAM2 training pattern using synchronization bits provided in the training sequence." to "It obtains block lock to the PHY frames during PAM2 training using synchronization bits provided in the training frames.".
P98, L28: Change: "training pattern is" to "training frames are".
P98, L30 as proposed

149.3.4.1 => 149.3.5 and Rename to "PMA training frame".

Slide 7: Page 98, L 30: partners. (Insert new text and figure here). <CR> PMA

Slide 9: Add labels where "(tx_rsfc)" is proposed, but make the labels "RS-FEC frame count".

Slide 10: P99, L50 - no change, instead remove tx_rsfc from the draft.
P99, L52 - no change
P100, L13 - delete "(tx_rsfc)"
P100, L18 - change: "u=tx_rsfc" to "Condition (where u = RS-FEC frame count)"
P100, L31 - change: "v=tx_rsfc" to "Condition (where v = RS-FEC frame count)"
Make all spaces on either side of "=" be non-breaking spaces.

Slide 11: Insert table, but change "RS-FEC Frame Time" to "RS-FEC frame count".

Add a row to the table before alert_period: alert_length; 4
P100, L8 Change: "ALERT, a four RS-FEC frame, shall" to "ALERT, a four RS-FEC frame long sequence (alert_length), shall".

Slide 12: Implement as proposed, except:
Page 99 line 11: Insert after first sentence the following sentence:
"The LPI timing parameters are shown in Table 149-XXX."

alert_detect is defined as primitive from the PMA,
PMA_ALERTDETECT.indication(alert_detect). However,
PMA_ALERTDETECT.indication(alert_detect) isn't actually a defined PMA primitive.

SuggestedRemedy

on page 80 line 26, insert
"149.2.2.11 PMA_ALERTDETECT.indication
This primitive is generated by PMA Receive to indicate the status of the receive link at the
local PHY when rx_lpi_active is TRUE. The parameter alert_detect conveys to the PCS
receive function information regarding the detection of the LPI alert signal by the PMA
receive function. The criterion for setting the parameter alert_detect is left to the
implementer.
149.2.2.11.1 Semantics of the primitive
PMA_ALERTDETECT.indication (alert_detect)
The alert_detect parameter can take on one of two values of the form:
TRUE The alert signal has been reliably detected at the local receiver.
FALSE The alert signal at the local receiver has not been detected.
149.2.2.11.2 When generated
The PMA generates PMA_ALERTDETECT.indication messages to indicate a change in the
alert_detect
status.
149.2.2.11.3 Effect of receipt
The effect of receipt of this primitive is specified in 149.3.2.3, Figure 149-17."

McClellan, Brett   Marvell

Comment Type **T**   *Comment Status* **A**   *EEE*

"Editor's note to be removed in draft 1.3: The OAM request to exit LPI is unneeded. Commenters are requested to provide text and edits necessary to cleanly remove this function and describe the local fault mechanism for the RS to signal exit from LPI."
This function was added in Clause 97 (1000BASE-T1) to cause the local device to exit low power idle when the link partner receiver is having trouble tracking the low power idle refresh signaling. However this function may not be necessary in an XGMII based system. Also the mechanism of exiting LPI is not described. An XGMII based PHY could generate Local Fault signals toward the Reconciliation Sublayer in a low SNR condition. The RS would respond by sending Remote Faults to the link partner, causing the link partner to stop sending LPI and start sending Idle until the fault condition is cleared. The downside to this mechanism is that the data link is interrupted in the path from the link partner to the local device.
I propose we keep the current mechanism of exiting LPI based on the OAM SNR indication but clarify how the LPI is exited.

SuggestedRemedy

on page 69 line 42
Change: "When the PHY Health status received from the link partner indicates that LPI is insufficient to maintain PHY SNR, the PHY may temporarily exit LPI mode and send idles."
To: "When the PHY Health status received from the link partner indicates that LPI is insufficient to maintain PHY SNR, the PHY shall temporarily exit LPI mode and send idles by replacing an LPI symbol group received at the XGMII with Idle symbols until the link partner no longer indicates insufficient SNR."

den Besten, Gerrit   NXP Semiconductors

Comment Type **T**   *Comment Status* **A**   Test Modes

Clock jitter specifications are currently defined on a divided clocks. For higher data rates it is strongly recommendable to measure jitter at speed directly from the transmit path and not via a divided pattern or separate test clock as these might mask effects that are important to meet performance.

SuggestedRemedy

Propose to change test mode 2 for measuring master transmit jitter on MDI at full speed, using a togging {+1} {-1} symbol pattern.
This is technically a divide-by-two clock where both rising and falling zero crossings are taken into account for measurements.

Current the droop requirement is specified as "the magnitude of both the positive and negative droop shall be less than 15%, measured with respect to an initial value at 4 ns after the zero crossing and a final value at 16 ns after the zero crossing (12 ns period)". This spec is currently independent of the speed, which makes this period contain 4x more symbols at 10Gbps than at 2.5Gbps. This implies a significantly larger BLW at 2.5Gbps which increases the peak differential amplitude. If the measurement period is made a fixed number of symbols or a period length scaling by 1/S, the signal impact of droop is equivalent for all rates.

SuggestedRemedy

Propose to scale the droop measurement period with the speed, so replace 4, 16 and 12, by 4/S ns to 16/S ns (12/S ns period). Alternatively, this measurement period can be specified as "initial value 24 symbol periods after the zero-crossing and a final value 96 symbol periods after a zero-crossing (72 symbol periods)"

Response   *Response Status* **C**

REJECT.

No consensus in the room to make the change.

den Besten, Gerrit   NXP Semiconductors

Comment Type **T**   *Comment Status* **R**   Test Modes

"The band-pass bandwidth of the measurement device shall be larger than 200 MHz." This is probably based on a divide-by-32 clock, that would run at 5625/32=175.8MHz, so 200MHz wouldn't be limiting in that case. Note that higher frequency jitter is partly masked in this case.

SuggestedRemedy

Propose to adapt test mode 2 to a symbol rate toggling {+1} {-1} pattern and measure jitter with a bandwidth of the measurement device of at least Fmax.

Response   *Response Status* **C**

REJECT.

The proposed change in the comment does not contain sufficient detail so that the TF can understand the specific changes requested by the commenter. Transmit PSD mask. During the Vancouver meeting I've presented modifications to the Transmit PSD mask. There have been interactive discussion on this with some modifications to the material. The decision on this topic was postponed to the next meeting to give people time to review internally.

SuggestedRemedy

Propose to change transmit PSD mask according to the attached presentation.

Response   *Response Status* **C**

REJECT.

No consensus to make change in DenBesten_3ch_01_0419.pdf.

This presentation was based on transmit power of -0.5 dBm to 2.5 dBm; however, the group changed this range to -1.5 dBm to 1.5 dBm, reducing the low frequency dBm. It may be desirable to repeat this analysis with these new approved transmit power limits. The graphs on slide 3 appear to be in error as these represent a transmit power range of 6 dB, not 3 dB as indicated on slide 2.

It was decided not to scale the droop measurement with PHY speed, so scaling the low frequency of the lower mask seems unnecessary.

The TBDs need to be filled in, and when doing so, the structure of the sentence needs to be changed to reflect that with a constant alien crosstalk coupling the noise level will shift. Suggest the numbers for 10GBASE-T1 in sederat_3ch_0419.pdf, adjusted for 2.5G and 5GBASE-T based purely on the difference in disturbing PSD levels, not on receiver noise tolerance, which would require more work on cabling and different cable specs for these technologies.

SuggestedRemedy

Replace "bandwidth of TBD MHz, and magnitude of TBD dBm/Hz" with "bandwidths and magnitudes shown in Table 149-xx"
Insert Table 149-xx (autonumbered) after Figure 149-41, with entries (commas between columns, semicolons for rows)
Header row: "PHY Type", "Noise Bandwidth (MHz)", "Added Noise at MDI (dBm/Hz)";
and body rows:
10GBASE-T1, 3000 MHz, -152 dBm/Hz;
5GBASE-T1, 1500 MHz, -149 dBm/Hz;
2.5GBASE-T1, 750 MHz, -146 dBm/Hz;

Comment 228 from draft 1.1 was implemented incorrectly. Accepted resolution specified the noise level is at the MDI of the DUT. Language also needs editorial clean up. The proposed response is aligned with accepted language in 802.3cg D3p0.

SuggestedRemedy

Change: "The test is performed with a noise source consisting of a signal generator with Gaussian distribution, bandwidth of TBD MHz and magnitude of TBD dBm/Hz."
to: "The test is performed with a noise source such that noise with a Gaussian distribution, bandwidth of TBD MHz, and magnitude of TBD dBm/Hz is present at the MDI of the DUT."
Editorial license to fill in the TBDs based on other comments.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

TBDs and minor rewording are in Comment #88.

Cl **149**	*SC* **149.7.1.3**	*P* **159**	*L* **22**	*#* 81

den Besten, Gerrit   NXP Semiconductors

Comment Type **T**   *Comment Status* **R**   *Link Segment*

For 10Gbps operation the worst-case link segment IL and RL, combined with module-internal losses, driver level tolerance, and termination impedance range, makes that echo magnitude at Nyquist can be >40x the received the signal magnitude. Scanning through previously presented RL data, the main reasons for the fairly loose link segment RL specs are the issues towards 5.5GHz (which are eliminated now as Fmax is always 4GHz or less) and the inclusion of a 'first connector profile'. All cases with the second and third connector profiles (DiBiaso_3ch_01_0518.pdf) pass with much margin. I think we should consider to tighten the link segment return loss spec for 10Gbps at high attenuation and not unnecessarilly burden the transceiver.

SuggestedRemedy

Propose to add an extra limit curve to 10Gbps_RL:
N=-1 for IL>24dB
(brings first corner to 960MHz and HF plateau to 15dB)

Note that this situation does not occurs for cables <12m.

Response   *Response Status* **C**

REJECT.

den Besten, Gerrit   NXP Semiconductors

Comment Type **T**   *Comment Status* **R**   Link Segment

The current coupling attenuation spec, originating from contribution mueller_3ch_02a_0518.pdf might be insufficient to ensure signal integrity. On slide 4 it states that "With existing cables and connectors an introduced differential noise level of a few mV (4mV or less) is achievable in a BCI test with 200mA interfering current." which seems based on ... Note that the suggested templates in that ppt don't seem to have a 6dB/octave slope. Which BCI level is assumed achievably by these transceivers? And is this 4mV safeguarded by the coupling attenuation template or is this just these actual cables showed that result? Note that these cables are apparently better then the specified template. The differential signal magnitude at Nyquist can be about the same level of a few mV. I think we should ensure that the injected interfering differential signal component (due to coupling attenuation) should be at least 6dB below the signal level. Therefore it seems that the coupling attenuation spec needs to be tightened. Looking at the more recently measured coupling attenuation curves the corner can be shifted without problem to 1GHz, but that might not yet be sufficient.

SuggestedRemedy

Replace:
750 MHz --> 1000 MHz
70 dB for f<1000 MHz
70-20*log(f/1000) for 1000<f<Fmax Mhz

Response   *Response Status* **C**

REJECT.

The commenter may choose to provide a presentation at a future meeting or ad hoc with data to support this and may choose to submit a comment at WG ballot.

The group would like additional information on how BCI impacts this since it only tests to 400 MHz.

The group would like to see test data on multiple cables and connectors.

den Besten, Gerrit   NXP Semiconductors

Comment Type **T**   *Comment Status* **R**   Link Segment

Maximum specified frequency for coupling attenuation has been adapted to Fmax, which make perfect sense for a single-speed transceiver. For multi-speed transceivers, it might not be desirable to mandate the need for frequency-scaling anti-aliasing filters in the design. In order to circumvent that and not overspecify channels generally, a good solution could be to require that the link segment shall meet the requirements of the highest supported rate at that port.

SuggestedRemedy

Insert after line 42:
For multi-speed transceivers the link segment shall meet the coupling attenuation requirements for highest supported rate on the MDI.

Response   *Response Status* **C**

REJECT.

IEEE802.3 does not specify implementation requirements or multi-speed PHYs.

den Besten, Gerrit   NXP Semiconductors

Comment Type   **T**   *Comment Status*   **R**   *MDI*

There is currently only one MDI return loss template for all speeds. I think we should differentiate requirements for different speeds to allow looser spec for 2.5Gbps and 5Gbps. The easiest way to achieve this is by scaling all frequency values by S except for the 1MHz lower bound.

SuggestedRemedy

Change:
10 --> 10S
500 --> 500S
3000 --> 3000S
4000 --> Fmax

Remove:
For 2.5GBASE-T1, 5GBASE-T1, and 10GBASE-T1, the maximum applicable frequency for the MDI return loss is 4000 × S MHz.

Response   *Response Status*   **C**

REJECT.

Most PHYs don't scale the return loss template with speed. It's a function of the cable's insertion loss.

Cl **149**   *SC* **149.8.2.1**   *P* **163**   *L* **20**   # 82

den Besten, Gerrit   NXP Semiconductors

Comment Type   **T**   *Comment Status*   **R**   *MDI*

I would like to make explicit that the low-frequency roll-up is there to enable PoDL, and that without PoDL the RL extends at 20dB downto 1MHz.

SuggestedRemedy

Split the low-frequency spec in two options:
with PoDL: 20-20*log(f/10S) dB
without PoDL: 20dB

Response   *Response Status*   **C**

REJECT.

The equation seems to be incorrect and is not what is currently in the spec.

There is no reason to have a tighter requirement on the MDI RL when PoDL is not used.

Cl **149**   *SC* **149.8.2.1**   *P* **163**   *L* **20**   # 76

den Besten, Gerrit   NXP Semiconductors

Comment Type   **T**   *Comment Status*   **R**   *MDI*

The MDI return loss at high frequency is tighter than necessary IMO. The MDI is far-end return loss which gets twice attenuated by insertion loss. This return loss component therefore doesn't worsen the RL/IL ratio. I think the currently specified link segment return loss and MDI return loss are not well balanced for a cost optimal solution. I would like to propose to relax the MDI return loss and if possible tighten the link segment return loss.

SuggestedRemedy

Formula 12-10log(f/3000) change into 10-10*log(f/3000S) for 300S<f<3000S
Formula 12-20*log(f/3000) change into 10-20*log(f/3000S) for 3000S<f<Fmax
