*** Comment submitted with the file 103045400003-Figure149A-2_Comment_RevA.pdf attached ***

To make Figure 149A-2 more descriptive.

SuggestedRemedy

As per attached PDF; Propose to change Figure 149A-2 as follows; From the VNA Diff. Port 1 both these lines are to be coax. Therefore; The lines are made to be thicker to match the width of coax line from as from Port 2; Add that the text to each line from Diff. Port 1 of "Coax"; Add lines that show that each of the Coax shields from Diff. Port 1 connects to the shield of connector on the test fixture; Show an exploded view that inner tube is connected to cable shield inside triaxial tube; Include the text next to this exploded view.

Propose to add verbiage to the shield connection of the cable on both ends to assist user with proper understanding of implementing into vehicle.

SuggestedRemedy

Add the following to sentences at the end of paragraph that starts on line 6. . In addition, both ends of the cable shield should be directly connected to the signal ground using techniques suitable for RF applications in the frequency range of interest when implementing cable assemblies into vehicles. This is necessary so that the vehicle implementation matches the coupling and screening attenuation test methodology in this Annex.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

It is not necessary to explain why the requirement exists.

ADD the following sentence at the end of paragraph that starts on page 198 line 6. "In addition, both ends of the cable shield should be connected to the reference plane using techniques suitable for RF applications in the frequency range of interest, see 149.7.1.4 and 149.7.1.5, when implementing cable assemblies into vehicles. "

Comment Type **TR**   *Comment Status* **A**   149A

Text does not adequately deal with specifying a uniform test condition for qualifying the test conditions for link segments in an automotive environment. Text should be added to reflect the shield grounding practice used in that environment.

SuggestedRemedy

Insert the following text before the existing text on Page 198, Line 24: The shield of the cable shall have a hard ground connection to the connected equipment at each end of the reference cable assembly.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

It is not clear what a "hard ground" connection means.

Add the text as defined in comment i-48, copied below.

ADD the following sentence at the end of paragraph that starts on page 198 line 6. "In addition, both ends of the cable shield should be connected to the reference plane using techniques suitable for RF applications in the frequency range of interest, see 149.7.1.4 and 149.7.1.5, when implementing cable assemblies into vehicles. "

using the term "both" appears verbose in nearly 20 instances.

SuggestedRemedy

Remove the work "both"

Response   *Response Status* **W**

REJECT.

The word "both" is found 24 times in the document. The proposed change in the comment does not contain sufficient detail so that the CRG can understand the specific changes that satisfy the commenter. The commenter does not specify which "nearly 20" instances should be deleted. This is used in the front matter 3 times and 21 times in the "new text". A search of 802.3-2018 shows that the word "both" is found 938 times. This is a word commonly used in this specification to indicate that there are two conditions or two actions.

Regarding the specific instance cited in the comment at page 40 line 36, the CRG disagrees with the commenter. The use of 'both' in this instance is not extraneous and clarifies that MultiGBASE-T1 OAM capability requires support by both the local PHY and its link partner.

Table 45-155c, bits 1.2311.12:11 description indicates that values L=2 is Reserved for 2.5GBASE-T1, and L=4 is reserved for 2.5GBASE-T1 and 5GBASE-T1, but the specification does not appear to say what happens if the control register is set to those values - what will L be in those cases - will those values be requested, or will something be substituted? The same issue exists in Table 45-155d and 45.2.1.195.1 Further -the term "reserved" is not correct. what we mean is that those values are not defined.

SuggestedRemedy

Suggest: (1) changing "Reserved" to "undefined" in the description of bits 1.2311.12:11 in Table 45-155c, and (2) to add a new paragraph to 45.2.1.194.1 stating, "The values of L = 2 and L=4 are not defined for 2.5GBASE-T1 PHYs, and the value of L=4 is not defined for 5GBASE-T1 PHYs. If bits 1.2311.12:11 are set to these values, the PHY will communicate these values to the link partner, but the requested interleaver depth is out of scope of this standard and may not be supported by the link partner." Add a new paragraph to 45.2.1.195.1 stating, "The values of L = 2 and L=4 are not defined for 2.5GBASE-T1 PHYs, and the value of L=4 is not defined for 5GBASE-T1 PHYs. Bits 1.2312.12:11 will indicate whatever value is received from the link partner, but if the undefined values are received, the requested interleaver depth is out of scope of this standard and may not be supported by the local PHY."

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Not all instances of "Reserved" should be changed to "undefined" in the identified cell, also the spacing around the "=" is not consistent in the suggestion.

Change "Reserved" to "undefined" for the values 01 and 10 in the description of bits 1.2311.12:11 in Table 45-155c, and (2) to add a new paragraph to 45.2.1.194.1 stating, "The values of L = 2 and L = 4 are not defined for 2.5GBASE-T1 PHYs, and the value of L = 4 is not defined for 5GBASE-T1 PHYs. If bits 1.2311.12:11 are set to these undefined values, the PHY will communicate these values to the link partner, but the requested interleaver depth is out of scope of this standard and may not be supported by the link partner." Add a new paragraph to 45.2.1.195.1 stating, "The values of L = 2 and L = 4 are not defined for 2.5GBASE-T1 PHYs, and the value of L = 4 is not defined for 5GBASE-T1 PHYs. Bits 1.2312.12:11 will indicate whatever value is received from the link partner, but if the undefined values are received, the requested interleaver depth is out of scope of this standard and may not be supported by the local PHY."

The overview and the draft indicate that clause 149 operates over a single balanced pair of conductors. As in other standards, this may include either cabling or a backplane link segment. However, in several portions of the link segment specification, the requirements are written so that ONLY a separate cabling link segment can be used. this is in conflict with the overview and purpose. A slight adjustment to the wording, and a conditional on the PICS will make it clear that requirements such as coupling attenuation and shielding attenuation are only intended to apply to cabling link segments.

SuggestedRemedy

page 167 line 10 : At 149.7, change the last sentence of the first paragraph from "The term link segment used in this clause refers to a single shielded balanced pair of conductors operating in full duplex. " to "The term link segment used in this clause refers to a single balanced pair of conductors (cable or backplane) operating in full duplex. "; Page 171 line 31: at 149.7.1.4, change the first sentence from "when tested using the IEC 62153-4-7 triaxial tube in tube method as specified in Annex 149A, the MultiGBASE-T1 link segment shall meet the coupling attenuation values " to "when tested using the IEC 62153-4-7 triaxial tube in tube method as specified in Annex 149A, where shielded balanced pair cabling is used, the MultiGBASE-T1 link segment shall meet the coupling attenuation values" ; Page 172 line 27: Change the first sentence of 149.7.1.5 for "The minimum screening attenuation..." to read "Where shielded balanced pair cabling is used, the minimum screening attenuation..."; Page 174 line 36: Change the first sentence of 149.8.1 from "The mechanical interface to the shielded balanced cabling " to "Where shielded balanced pair cabling is used, the mechanical interface to the shielded balanced cabling"; Page 179 line 10, 149.11.3, insert row for *INS after row for *EEE, reading "*INS | Installation / cabling | 149.7 | Items marked with INS include installation practices and cabling specifications applicable when the link segment is balanced pair cabling, and not applicable to backplane link segments | O | Yes []<cr> No []" ; on page 193 line 12, Change status of row for LSC5 to "M:INS"

The parameter pcs_status is passed to the PMA from the PCS, but other than showing it is being passed in figure 149-26 to PMA_Receive and PHY_Control, there is no mention of this parameter's effect on behavior. It appears that pcs_status may be used in the determination of loc_rcvr_status, because it indicates block lock in the PCS and RS-FEC behavior. Additionally, neither pcs_status nor scr_status are used in the PHY Control state diagram as indicated in Figure 149-26.

In draft 2.0, pcs_status was in the link monitor state diagram, but in the current draft this has been replaced by pcs_data_mode. pcs_status = OK requires the hi_rfer indication to be false, but pcs_data mode doesn't - it just requires PHY Control to have progressed to data mode, which initially requires hi_rfer to be false, but not continually.

If the link_monitor goes to fail, the link goes down and pcs_data_mode is set false by the link_synchronization state diagram (or autoneg) resetting the phy control.

Reading through this, it looks to me like the new state diagrams can operate in a perpetual state of hi_rfer or even loss of pcs block lock. That could be a problem, but can be remedied if loc_rcvr_status may be set with the information from pcs_status.

SuggestedRemedy

Change Figure 149-26 to delete connection of pcs_status to PHY Control, and change the first sentence of the third paragraph of 149.4.2.3 (P145 L5) from "The PMA Receive function uses the scr_status parameter and the state of the equalization, cancellation, and estimation functions to determine the quality of the receiver performance, and generates the loc_rcvr_status variable accordingly." to "The PMA Receive function uses the parameters pcs_status and scr_status, and the state of the equalization, cancellation, and estimation functions to determine the quality of the receiver performance, and generates the loc_rcvr_status variable accordingly."

Response   *Response Status*   **C**

ACCEPT IN PRINCIPLE.

The actual signal line into "PHY CONTROL" is "scr_status / pcs_status". This also needs to be corrected in Figure 149-2.

Change Figure 149-2 to delete the connection of "pcs_status / scr_status" to PHY CONTROL, change Figure 149-26 to delete connection of "scr_status / pcs_status" to PHY CONTROL, and change the first sentence of the third paragraph of 149.4.2.3 (P145 L5) from "The PMA Receive function uses the scr_status parameter and the state of the equalization, cancellation, and estimation functions to determine the quality of the receiver performance, and generates the loc_rcvr_status variable accordingly." to "The PMA Receive function uses the parameters pcs_status and scr_status, and the state of the equalization, cancellation, and estimation functions to determine the quality of the receiver performance, and generates the loc_rcvr_status variable accordingly."

The Link Monitor state diagram (Figure 149-33) uses the variable PMA_refresh_status for one of its transitions but the behavior is not defined anywhere.
Section 149.4.4.1 indicates that it indicates the status of the Refresh Monitor and is described in 149.4.2.7, but there isn't any definition there.
The Refresh Monitor (Figure 149-34) sets loc_rcvr_status to NOT_OK upon failure, which causes the same transition in the Link Monitor state diagram as PMA_refresh_status=FAIL, so I suspect that a change was made and some of the references to PMA_refresh_status were not removed. Further, the definition of loc_rcvr_status elsewhere is listed as 'implementation dependent' and the result of monitoring the receiver performance (149.2.2.7 and 149.4.2.3) - having behavior defined in a state diagram contradicts these statements.

SuggestedRemedy

In Figure 149-33, add PMA_refresh_status <= OK to state LPI_OK and add PMA_refresh_status <= FAIL to state LPI_REFRESH_TIMEOUT. (<= is used here to indicate the assignment operator). Change the fourth sentence of 149.4.2.7 from "The function forces a link retrain" to "The refresh monitor sets the PMA_refresh_status variable, which forces a link retrain"...

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

The incorrect figure was referenced in the suggested remedy.

In Figure 149-34 (EEE Refresh monitor state diagram), add PMA_refresh_status <= OK to state LPI_OK and add PMA_refresh_status <= FAIL to state LPI_REFRESH_TIMEOUT. (<= is used here to indicate the assignment operator).

Change the fourth sentence of 149.4.2.7 from "The function forces a link retrain" to "The refresh monitor sets the PMA_refresh_status variable, which forces a link retrain"…

Equation 149-25 draws this required line based on the measurement results when all the cables configured around are composed of STP cables in the 4 around 1 measurement. Therefore, I think it is necessary to include a comment that clearly states that all the cables that are configured around are STP cables. This is because it is assumed that it is difficult to satisfy this requirement when the surrounding cables are composed of cables such as J-UTP cable and UTP cable.

SuggestedRemedy

After Equation 149-25, please add as follows. However, this equation is for the case where the surrounding cables are composed of STP cables.

Response   *Response Status* **C**

REJECT.

The CRG disagrees with the commenter. This equation defines what is required for the PHYs to operate properly. This applies to all link segments. While it is likely that only shielded cables can meet this requirement, specifying that this requirement only applies to shielded cables would have the unintended side effect of allowing a violation of this equation's limits if unshielded cables were used.

In multiport designs, there is confusion as to whether port-to-port crosstalk in the MDI or on the board are goverend by the "coupling between link segments" (alien crosstalk) specified in the main clause. They are not. MDI to MDI coupling or trace to trace coupling are in addition. In general, they should be less than or equal to the alien crosstalk specification.

SuggestedRemedy

Insert 149.C.5 after 149C.4.3, entitled: Coupling between ports on multiport designs, with text: "When multiple MultiGBASE-T1 PHYs are implemented on the same board, care should be taken to avoid coupling between ports. The coupling between adjacent ports on a multiport MDI connector or between adjacent traces is recommended to be approximately the same level, but no greater, than that specified for power sum alien near end crosstalk specified in Equation 149-25." Additionally, add a second paragraph to 149.7.2, page 172 line 42, to read "For implementations with multiple MultiGBASE-T1 ports on the same MDI connector assembly, coupling between ports on the MDI connector is not considered to be part of the PSANEXT and PSAFEXT specification. For further information, see 149.C.5."

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

At the end of the proposal "specification" should be "specifications" and remove specific types of crosstalk and replace with alien crosstalk.

Insert 149.C.5 after 149C.4.3, entitled: Coupling between ports on multiport designs, with text: "When multiple MultiGBASE-T1 PHYs are implemented on the same board, care should be taken to avoid coupling between ports. The coupling between adjacent ports on a multiport MDI connector or between adjacent balanced pairs is recommended to be approximately the same level, but no greater, than that specified for power sum alien near end crosstalk specified in Equation 149-25." Additionally, add a second paragraph to 149.7.2, page 172 line 42, to read "For implementations with multiple MultiGBASE-T1 ports on the same MDI connector assembly, coupling between ports on the MDI connector is not considered to be part of the alien crosstalk specifications. The conditions and duration for which these defined warning bits are left to the implementor to decide, but how long should the indicator bits be set =1 to ensure the management entity at the link partner has an opportunity to detect these status bits?
These bits are not placed into latched indicators at the link partner, but are continuously updated in registers 1.2318 and 1.2319 as they arrive.
For these bits: PowerSupplyWarning, PHY TempWarning, No MACMessagesWarning, DegradedLinkSegment we should recommend a minimum indication time.
PolarityInversion is a static condition throughout the link, and therefore not an issue

SuggestedRemedy

page 203 on lines 9, 18, 26, and 35 add the following sentence: "It is recommended that this status is set for a minimum of 100 milliseconds to ensure reception by the link partner management entity."

Response   *Response Status* **C**

Type B and Type F have separate 'shalls' and Type F should not be added to PICS PD20 and PD22. Additionally this creates confusion as to which return loss needs to be used for which type... Also, the option code should be PDTF in both cases, not PSETF on the first row...

SuggestedRemedy

Change editing instruction from "Change item PD20 and item PD22 in the table in 104.9.4.3 as follows (unchanged rows not shown):" to "Insert new PICS item PD20a after item PD20, and new PICS item PD22a after item PD22 in the table in 104.9.4.3 as follows (unchanged rows not shown):" - change PICS items in rows to read: "PD20a | Type F PD ripple and transients | 104.5.6.4 | In accordance with specifications shown in Table 104-7 for all operating voltages in the range of VPD sourced through a dc bias coupling network with MDI return loss as specified by Clause 149, and over the range of PPD. | *PDTF:M | Yes [ ]" and "PD22a | Type F PD measured ripple voltage post-processing | 104.5.6.4 | With transfer function H2(f) specified in Equation (104-3) where f2 = 10 MHz +/- 1% | *PDTF:M | Yes [ ]"

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

An additional change is needed.

Before 104.9.4.3 add "104.9.4 PICS proforma tables for Clause 104, Power over Data Lines (PoDL) of Single Balanced Twisted-Pair Ethernet" title for the subclause above this Clause.

Remove the rows PD20 and PD22.

Also, make the change requestesd by the commenter: Change editing instruction from "Change item PD20 and item PD22 in the table in 104.9.4.3 as follows (unchanged rows not shown):" to "Insert new PICS item PD20a after item PD20, and new PICS item PD22a after item PD22 in the table in 104.9.4.3 as follows (unchanged rows not shown):"

- add PICS items rows: "PD20a | Type F PD ripple and transients | 104.5.6.4 | In accordance with specifications shown in Table 104-7 for all operating voltages in the range of VPD sourced through a dc bias coupling network with MDI return loss as specified by Clause 149, and over the range of PPD. | *PDTF:M | Yes [ ]"

and "PD22a | Type F PD measured ripple voltage post-processing | 104.5.6.4 | With transfer function H2(f) specified in Equation (104-3) where f2 = 10 MHz +/- 1% | *PDTF:M | Yes [ ]"

Comment Type **T**   *Comment Status* **A**   *RS-FEC*

The following text is confusing as it is not clear what constitute the leftmost/LSB element: "For both x and c (see 149.3.2.2.17) the encoder shall follow the notation described in 149.3.2.2.3 where the LSB (leftmost element of the vectors x and c) is the first bit into the RS-FEC encoder and the first transmitted bit." x infers a position and there is no concept of MSB or LSB. c is a vector with MSB and LSB, but which bit of c is considered the MSB/LSB? For example page 102 line 6 m is the bit vector <m9, m8, m7, m6, ... m0> is m0 the LSB, or the leftmost element m9 the LSB? This text is not really necessary since 149.3.2.2.17 describes things in adequate detail.

SuggestedRemedy

My preference is to delete "For both x and c (see 149.3.2.2.17) the encoder shall follow the notation described in 149.3.2.2.3 where the LSB (leftmost element of the vectors x and c) is the first bit into the RS-FEC encoder and the first transmitted bit." since 149.3.2.2.17 adequately describes this. But if we want to leave the text alone I'm ok.

Response   *Response Status* **C**

ACCEPT IN PRINCIPLE.

Comment Type **T**   *Comment Status* **A**   *RS-FEC*

The transmitted order of the codeword symbol can be made more explicit. Page 102 line 30 state bit 0 is transmitted first. From Page 102 line 6 m*i,0* can be inferred as bit 0 but this is not explictly stated. Page 100 line 29 adds to the confusion that states the leftmost element is the LSB and we have m*i,9* being the leftmost element.

SuggestedRemedy

Add the following for more clarity. Page 102 line 7 after the end of "finite field." add: "m*i,0* is the first bit transmitted." Add the following to make things complete. Copy first sentence in page 102 line 6 to page 102 line 22 except replace "message" with "parity" and "m", with "p", add: "p*i,0* is the first bit transmitted."

It appears that TX_WN may need a recirculating function if it is supposed to wait until tx_lpi_active is false before exiting, and continuously re-evaluate the condition tx_alert_start_next. State diagrams only evaluate the condition on entry to a state. Otherwise, if tx_alert_start_next were false on entry, TX_WN would enter, set tx_coded to IBLOCK_T and exit with tx_lpi_req possibly still in the true state (for example, if LPI is being exited due to a low SNR message). According to Figure 149-20, tx_lpi_active is set FALSE in TX_NORMAL and TRUE in SEND_SLEEP, which can only be exited by tx_lpi_req going to false.

SuggestedRemedy

Suggest: change the exit condition to exit "C" to add an " * (tx_lpi_req = FALSE)" to the existing condition, and add an additional exit to TX_WN, re-entering tx_WN with the condition tx_lpi_req = FALSE

Response   *Response Status*   **C**

ACCEPT IN PRINCIPLE.

Need to use standard state diagram conventions of !tx_lpi_req in the added conditions. Also, corrected error in the condition to re-enter TX_WN.

Change the exit condition to exit "C" to add an " * !tx_lpi_req" to the existing condition, and add an additional exit to TX_WN, re-entering TX_WN with the condition "tx_lpi_req".

This state diagram section including subclauses 149.4.2.6.1, 149.4.2.6.2, 149.4.2.6.3 and 149.4.2.6.4 lacks description of the state diagram conventions.
State diagram conventions are stated in 149.3.7.1 and 149.3.9.4.1, however the text states those conventions apply only to those subclauses.

SuggestedRemedy

Insert new subclauses and renumber remaining subclauses as needed.
"149.4.2.6.1 Detailed functions and state diagrams
149.4.2.6.1.1 State diagram conventions
The body of this subclause is comprised of state diagrams, including the associated definitions of constants, variables, functions, counters, and messages. Should there be a discrepancy between a state diagram and
descriptive text, the state diagram prevails.
The notation used in the state diagrams follows the conventions of 21.5. "
