Insertion Loss Limit Analysis

Current Status of Insertion Loss Limit

- Motion to modify currently adopted IL limit failed for multiple reasons
    - PHY developers are not concerned about more margin at this time
    - 26 AWG (0.13mm^2) cable is preferred for all applications up to 15m
    - Concerns with offset value in IL limit equation that is not dependent on frequency
- New Frequency Range should be
    - 5MHz to 3GHz
- Violations of the current IL limit still occur at lower frequencies

Cable Modeling Comparison (Diff. Pair)

10m Cable Only Insertion Loss (Sdd21)

$$IL_{dB}(f_{Hz}) < lm\left(C1\sqrt{f} + C2\,f\right)$$

Conclusions

- New IL Limits were investigated using 26AWG (0.13mm^2) cables @ 105C
- Mueller IL Limit proposed in March meeting had 0 violations after 500 iterations
- Another IL Limit was also proposed which had 0 violations and removed the 0.5 offset term from the equation
