## DFE-based model vs FFE-based model for Reference Rx of COM

IEEE P802.3ck Task Force Ad Hoc, 10/24/2018
Yasuo Hidaka, Phil Sun (Credo Semiconductor)

## Background

> There has been discussion on DFE-based model vs FFE-based model for reference Rx of COM

- DFE-based model
- CTLE (3 poles + 2 zeros) + many-tap DFE
- Represents analog-based Rx implementations
- Conventional model, well-established experience of 3dB COM criteria in the past
- We had consensus in the past standards to include quantization effect of DFE taps as part of 3dB COM budget
- FFE-based model
- CTLE (3 poles + 2 zeros) + 1-tap DFE + many-tap Rx FFE
- Represents ADC-based Rx implementations
- A new model, no experience of COM value criteria
- There is no consensus on how to include quantization effect of Rx-FFE taps as well as quantization effect of ADC
$\rightarrow$ We have studied which model is relevant for reference Rx in COM
CrędŐ

## Pre-cursor taps in FFE (a.k.a. FIR filter)

>Have a capability to adjust phase characteristics of system response

- Sampling phase
- Non-causal (a.k.a. non-minimum-phase) response
- E.g. large intra-pair skew
$>$ DFE-based model
- Pre-cursor taps are only in Tx
>FFE-based model
- Pre-cursor taps may be in Rx as well as Tx
- Pre-cursor taps in Rx may cause a problem for DFE-based solutions
- DFE-based Rx implementation may rely on capability of pre-cursor taps in Tx
- COM must check if channel has phase characteristics within capability of pre-cursor taps in Tx

## Simulation conditions and COM parameters

$>$ Two sets of simulations

- Sim1 : check the effects of pre-cursor taps in Rx in FFE-based model
- Sim2 : check the effects of step and constraints of taps and compare two models

| Simulation | Sim1: Effects of pre-cursor taps in Rx |  | Sim2: Effects of step and constraints |  |
| :---: | :---: | :---: | :---: | :---: |
| Model | FFE-based | DFE-based | FFE-based | DFE-based |
| Tx pre taps (step) | 3/1/0 (2.5, 4, 1\%) | 3 taps (2.5\%) | 3 taps (2.5\%) | 3 taps (2.5\%) |
| FFE post taps (step) | 1 tap (5\%) |  |  |  |
| Rx pre taps (step) | 3 / 0 taps (0\%) | N / A | 0 taps | N / A |
| FFE post taps (step) | 16 taps (0\%) | N / A | 16 taps (0, 1, 2.5\%) | N / A |
| Rx DFE taps (step) | 1 tap (0\%) | 16 taps (0\%) | $1 \mathrm{tap}(0,1,2.5 \%)$ | 16 taps (0, 1, 2.5\%) |
| Rx FFE max pre1 / post1 / tapn | 0.7 / 0.7 / 0.7 | N / A | $\begin{gathered} (0.7) / 0.7 / 0.7 \\ \text { or }(0.3) / 0.3 / 0.125 \end{gathered}$ | N / A |
| Rx DFE max b1/bn | 0.7 / (0.2) | 0.7 / 0.2 | $\begin{gathered} 0.7 /(0.2) \\ \text { or } 0.95 /(0.2) \end{gathered}$ | $\begin{gathered} 0.7 / 0.2 \\ \text { or } 0.95 / 0.2 \end{gathered}$ |
| Package model | $30 \mathrm{mm@87.5} 2+1.8 \mathrm{~mm} @ 92.5 \Omega, \mathrm{C}_{\mathrm{d}}=110 \mathrm{fF}, \mathrm{C}_{\mathrm{p}}=70 \mathrm{fF}$ |  |  |  |
| Noise, jitter | $\eta_{0}=8.20 \mathrm{E}-9 \mathrm{~V}^{2} / \mathrm{GHz}, \mathrm{SNR}_{\mathrm{TX}}=32.5 \mathrm{~dB}, \sigma_{\mathrm{RJ}}=0.01 \mathrm{UI}, \mathrm{A}_{\mathrm{DD}}=0.02 \mathrm{UI}, \mathrm{R}_{\mathrm{LM}}=0.95$ |  |  |  |

$0^{\circ}$ CrędŐ Other COM parameter values are shown in a backup slide.

## Channels used in this study

|  | Datafile pathname | Model | IL@26.6GHz | ICN |
| :---: | :---: | :---: | :---: | :---: |
| CH1 | mellitz_...072518_...meg6... | Ideal PCB trace | 28.0 dB | 0 mV |
| CH2 | mellitz_...072518_...twinax26... | Ideal Twinax cable | 28.0 dB | 0 mV |
| CH3 | mellitz_...081518_...CaBP_BGAVia_Opt1_24dB... | Cabled backplane w/ instrumented micro via | 23.3 dB | 0.755 mV |
| CH4 | mellitz_...081518_...CaBP_BGAVia_Opt1_28dB... |  | 27.2 dB | 0.565 mV |
| CH5 | mellitz_...081518_...CaBP_BGAVia_Opt1_32dB... |  | 31.0 dB | 0.437 mV |
| CH6 | mellitz_...081518_...CaBP_BGAVia_Opt2_24dB... | Cabled backplane w/ BGA region via | 22.6 dB | 0.880 mV |
| CH7 | mellitz_...081518_...CaBP_BGAVia_Opt2_28dB... |  | 26.3 dB | 0.652 mV |
| CH8 | mellitz_...081518_...CaBP_BGAVia_Opt2_32dB... |  | 30.1 dB | 0.498 mV |
| CH9 | mellitz_3ck_01_0518_C2M...Z100_IL10_WC... | C2M channels using FLYOVER cable | 9.96 dB | 4.5289 mV |
| CH10 | mellitz_3ck_01_0518_C2M...Z100_IL14_WC... |  | 13.87 dB | 3.1934 mV |

All channel data are taken from IEEE P802.3ck Task Force - Tools and Channels page.

FFE tap constraints: pre1max=0.7, post1max=0.7, tapnmax=0.7 $\quad$ DFE tap constraints: b1max=0.7, bnmax=0.2
C: The algorithm in COM Tool v2.52 was unable to find the sampling phase where all constraints of coefficients are satisfied.

## Discussion on Sim1 Results

$>$ Why capability of Tx-FFE pre-taps is hidden by Rx-FFE pre-taps ?

- Tx-FFE pre-taps have limited resolution
- Rx-FFE pre-taps have unlimited resolution
- It achieves high-precision adjustment of phase characteristics
- As a result, phase characteristics are adjusted always in high precision by high capability of Rx-FFE pre-taps regardless of limited capability of Tx-FFE pre-taps
$>$ Can we use limited resolution of Rx-FFE pre-taps as a work around?
- No. Even with limited resolution, Rx-FFE pre-taps will obscure requirements for channel phase characteristics in the COM test.
$>$ As a reference Rx model, FFE-based model should NOT have pre-cursor taps to support broader implementations (including DFE-based solutions)
- Because channels which needs extra adjustment of phase characteristics beyond capability of Tx-FFE (e.g. too much intra-pair skew) should fail COM test
- DFE-based Rx implementation without Rx-FFE pre-taps cannot support such channels

## Sim2 Results (1/2) (b1 $\mathbf{~} 0.7$ )

## Summary of Sim2 Results

> Performance of FFE-based and DFE-based are often similar

- Detail difference depends on the channel and the detail conditions
$>$ Behavior of FFE-based is contradictory to change of b1max
- If b1max is reduced (i.e. more constrained), COM is improved
$>$ COM is significantly affected by step size of DFE and FFE taps

## Conclusions

> Reference receiver should not have pre-cursor taps to support the development of Tx FIR

- Channel phase characteristics must be checked if it is within capability of Tx pre-cursor resolution and length to support broader implementations
- Pre-cursor taps of Rx FFE obscures requirements for channel phase characteristics
$>$ Some mismatches are observed between DFE- and FFE-based models
- A channel marginally passing one model might fails on the other model
- Expected although not observed in the simulated channel sets
- DFE does not amplify noise, but FFE does
- Additional constraints, e.g. ICN limit, may be studied to reduce the COM pass/fail mismatch
> Quantization noise, circuit distortion, circuit noise in Rx are implementation trade off
- In the past standards, we had consensus to include them as part of 3dB COM
- If we decide to add those factors to the reference Rx model, it will result in 3dB COM threshold change
- Efforts are needed to build consensus on what to include and what the threshold should be
$>$ If we choose one model, DFE-based model is recommended
- More studies are needed whether to add an additional FFE-based model
