Bruckman, Leon Huawei

Comment Type **E** *Comment Status* **R**

It is strange that the the bit error ratio in the data received from the far-end PCS can be estimated by dividing the BIP block error ratio by something, if you already have a error ratio why divide it?. I saw the same wording in other 802.3 cluses, but it sounds strange.

SuggestedRemedy

Change: "The bit error ratio in the data received from the far-end PCS can be estimated by dividing the BIP block error ratio by a factor of 1 081 344.",

to: "The bit error ratio in the data received from the far-end PCS can be estimated by dividing the BIP block errors by a factor of 1 081 344."

Response *Response Status* **C**

REJECT.
This is nearly identical text to the final para of 91.5.2.4, and to 82.2.15 from which it was derived, and the suggested remedy is technically wrong. The BIP values are actually generated by the far end PCS, and the intervening transcode/trans-decode steps should restore the sequence of bits over which they are calculated in the absence of errors. The calculation converts a block error ratio (the number of BIP violations over a unit of time) to an equivalent bit-error ratio (the estimate of the number of bit errors over that equivalent unit of time). You can't simply divide a count of block errors by a fixed value to get a BER, not knowing whether that block error count was over one second or one hour.

Draft 1.2 is technically complete with regard to SC-FEC lane alignment and synchronization. Nevertheless, there could be merit to separating the process descriptions for lane alignment and lane identification. Commenter is invited to build consensus for a complete and consistent proposal to be considered against Draft 2.0.

Cl **153** *SC* **153.2.3.3.5** *P* **89** *L* **34** # 16

Bruckman, Leon Huawei

Comment Type **T** *Comment Status* **A**

Since OTN devices may be used to implement the 100GBASE-ZR, and these devices support Cm values other than 188 and 189, there may be failure cases in which the GMP receiver receives values that are different from the ones in Table 153-1. What should the GMP demmaper do in this case ? Also what is expected the GMP demapper to do if DI=II=1 ?
On the other hand, there may be implementations based on OTN receivers that will be able to handle the situation, but there may also be 100GBASE-ZR targeted reduced functionality implementations that only accept the values specified in Table 153-1.

SuggestedRemedy

Add the following sentence: "If a C13:C0 value other than 188 or 189, or DI=1 and II=1 is received, the GMP demapper behavior is undefined."

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Implement the proposed resolution.

There is no harm in adding this sentence, although while the GMP mechanism is generic, there is no standardized mapping of a client other than 100GBASE-R directly into OPU4 via GMP. So any OTN kit that implements GMP mapping of a client into OPU4 should only be generating the indicated values)

Brown, Matt — Huawei Technologies Canada

Comment Type **T** *Comment Status* **D** *bucket*

The text in this paragraph does not match the architecture. There are three cases to consider as follows.
Case #1: SC-FEC connects directly to the PCS.
Case #2: SC-FEC connects directly to the Inverse RS-FEC, RS-FEC, Clause 135 PMA, etc.
Case #3: SC-FEC is connected to a Clause 83 PMA then through a CAUI-4 or CAUI-10 to the PCS.

This paragraph should address both Case #2 and #3.

SuggestedRemedy

Replace the paragraph with the following:
"The PCS may be connected to the SC-FEC using a physical instantiation of the PMA service interface (see Annex 83A, Annex 83B, Annex 83D, and Annex 83E) in which case a PMA (see Clause 83) is a client of the FEC service interface."
"The PCS may be connected to the SC-FEC using a physical instantiation of the PMA service interface (see Annex 135E and Annex 135G) in which case an Inverse RS-FEC (see Clause 152) is a client of the FEC service interface."

Proposed Response *Response Status* **Z**

Brown, Matt — Huawei Technologies Canada

Comment Type **T** *Comment Status* **A**

The change made in D1.2 is incorrect. It is a stream of DPQSK symbols transferred via the tx_symbol parameter. Although tx_symbol is earlier defined in the referenced 116.3 its reference here is somewhat mysterious.

SuggestedRemedy

Change 154.5.2. to the following:
"The PMD Transmit function shall convert the two DQPSK symbol streams requested by the PMD service
interface messages PMD:IS_UNITDATA_0.request(tx_symbol) and PMD:IS_UNITDATA_1.request(tx_symbol) into two DQPSK
optical signals on orthogonal polarizations and delivered to the MDI, all according to the transmit optical
specifications in this clause.
The PMD maps symbols from each tx_symbol parameter to phase changes to each of the DQPSK optical signals as specified in Table 154-4.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Change to "The PMD Transmit function shall convert the two DQPSK symbol streams requested by the PMD service interface messages PMD:IS_UNITDATA_0.request(tx_symbol) and PMD:IS_UNITDATA_1.request(tx_symbol) into two DQPSK optical signals on orthogonal polarizations and be delivered to the MDI, all according to the transmit optical specifications in this clause.
The PMD maps symbols from each tx_symbol parameter to phase changes to each of the DQPSK optical signals as specified in Table 154-4."

Cl **154** *SC* **154.5.3** *P* **105** *L* **39** # 68

Brown, Matt — Huawei Technologies Canada

Comment Type **T** *Comment Status* **A**

The change made in D1.2 is incorrect. It is a stream of DPQSK symbols transferred via the rx_symbol parameter. Although rx_symbol is earlier defined in the referenced 116.3, its reference here is somewhat mysterious. The list of primitives is two so connector should be "and" not "to".

SuggestedRemedy

Change the text in 154.5.3 to:
The PMD Receive function shall convert the composite optical signal received from the MDI into two
DQPSK symbol streams for delivery to the PMD service interface using the messages PMD:IS_UNITDATA_
0.indication(rx_symbol) and PMD:IS_UNITDATA_1.indication(rx_symbol), all according to the receive optical specifications in this clause.
The PMD maps the phase changes on each of the DQPSK optical signals to symbols on each rx_symbol parameter as specified in Table 154-4.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.
Change to:
"The PMD Receive function shall convert the composite optical signal received from the MDI into two DQPSK symbol streams for delivery to the PMD service interface using the messages PMD:IS_UNITDATA_
0.indication(rx_symbol) and PMD:IS_UNITDATA_1.indication(rx_symbol), all according to the receive optical specifications in this clause.
The PMD maps the phase changes on each of the retrieved DQPSK signals to symbols on each rx_symbol parameter as specified in Table 154-4."
and the last sentence of 154.5.3 to:
"Table 154-4 shows the mapping of the phase change of the retrieved DQPSK signals to the DQPSK rx_symbol streams for delivery to the PMD service interface."

With editorial license.

Stassar, Peter Huawei

Comment Type **TR** *Comment Status* **A**

At the January 2020 meeting in Geneva it was agreed to set the maximum chromatic dispersion to 1600 ps/nm. This is appropriate for black links containing 80 km of G.652 fiber. ITU-T SG15 at its recent closing plenary meeting 7 Feb 2020 consented revised Recommendation G.654, adding new fiber type G.654.E, optimized for low loss, but with somewhat higher chromatic dispersion values. This new fiber type should not be precluded for usage inside the black link, because it may be appealing for operators/users. The worst case chromatic dispersion over the wavelength range of interest is 24.14 ps/nm, leading to a worst case link dispersion of 1931 ps/nm. 2000 ps/nm would be an appropriate rounded number for 80 km links. The relevant ITU-T Recommendations provide a difference in maximum attenuation of 0.05 dB/km, implying a loss difference of 4 dB over 80 km.

SuggestedRemedy

Replace 1600 by 2000

Response *Response Status* **C**

ACCEPT.

Cl **154** *SC* **154.7.3** *P* **111** *L* **37** # 79

Stassar, Peter Huawei

Comment Type **TR** *Comment Status* **A**

A dispersion of -200 ps/nm will occur only when using G.653 (dispersion shifted) fibers, which are not anticipated to be used in C-band applications. Therefore the minimum chromatic dispersion should be 0 ps/nm for 0 km.

DeAndrea, John Finisar II-VI

Comment Type **E** *Comment Status* **R**

This sentence is unclear, "However, it does not enable interoperability at multichannel points between the optical multiplexer and demultiplexer that are likely to be included in the black link" What are multichannel points? If a single channel is only supported through one transfer characteristics, then mentioning interoperability through multichannel points is not needed.

SuggestedRemedy

Drop sentaence.

Response *Response Status* **C**

REJECT.
The quoted sentence refers to an essential characteristic of the black link, that it contains points where more than one channel is present in the fiber and that at those points the interoperability is not supported by the specification.

DeAndrea, John Finisar II-VI

Comment Type **T** *Comment Status* **A**

TBD value for receiver damage threshold.

SuggestedRemedy

For amplified links, 48 channel system can have 48 channels launched at +1 dbm for 80 km link. Total amplified power for +1 dBm launch power, 48 channels, 17.8 dBm total power is realized. Occassionally, mistakes are made, and this total power is applied to a receiver without a DeMux or fiber span. Suggest using 18 dBm as maximum damage threshold for receiver damage threshold.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

The TBD was addressed in comment 77 however is not attempting to cover misconnections from inside the black link directly into the receiver.

Cl **154** *SC* **8.1** *P* **110** *L* **52** # 98

DeAndrea, John Finisar II-VI

Comment Type **T** *Comment Status* **D**

Specific test patterns are not required, based on Clause 153.2.3.2.5 SC-FEC encoder, and Clause 153.2.3.2.6 Scrambler for dual polarization optical signals. The scrambler and dual carrier channels provide enogh randomization for optical signal parameter messurment and compliance.

SuggestedRemedy

Modify 154.8.1 to: "Compliance is to be achieved in normal operation, and Clause 153.2.3.2.5 SC-FEC encoder, and Clause 153.2.3.2.6 Scrambler, provide a sufficient pseudo random signal for transmit parameter measurments."

Response *Response Status* **C**

ACCEPT.

Cl **154** *SC* **154.8.1** *P* **111** *L* **11** # 102

Schmitt, Matt CableLabs

Comment Type **T** *Comment Status* **A**

For the TBD value of "Damage threshold" in Table 154-9, the most energy that could hit the receiver if a transmitter and receiver are connected back to back would nominally be the same as the max output from the transmitter as defined in Table 154-8. However, if the signal were fed into an optical ampplifier before being connected to the receiver it could be much higher. Therefore, for additional safety in this case, propose setting the value to +18 dBm.

SuggestedRemedy

Change "TBD" to "18" for "Damage threshold" in Table 154-9.

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Schmitt, Matt CableLabs

Comment Type **T** *Comment Status* **A**

In table 86-10, Optical Return Loss is defined as being measured at point TP2 looking downstream into the fiber. Therefore, having "Optical return loss" in Table 154-8 and "Optical return loss at TP2" in Table 154-10 is redundant, since they are both the same thing measured at the same point (one implicitly, one explicitly). To be consistent with other usage in 802.3, propose keeping "Optical return loss" in Table 154-8, and removing "Optical return loss at TP2" from Table 154-10.

SuggestedRemedy

Delete the row from Table 154-10 for "Optical return loss at TP2".

Response *Response Status* **C**

ACCEPT IN PRINCIPLE.

Remove "Optical return loss" in Table 154-8 and leave it in Table 154-10.

Lewis, David Lumentum

Comment Type **T** *Comment Status* **D**

Optical return loss tolerance should be a minimum value, not maximum. For example, a return loss from the black link of 24 dB would result in more power reflected back into the transmitter and a return loss from the black link of 26 dB would result in less power reflected back into the transmitter. Therefore the limit value of 25 dB is a minimum, not a maximum.

SuggestedRemedy

Change description to "Optical return loss tolerance (min)"

Proposed Response *Response Status* **Z**
