A PROPOSAL FOR PHY LINK CHANNEL FEC

Avi Kliger and BZ Shen

Submitted to PHY Link Ad-hoc group June 17th 2013

PLC CONSIDERATIONS

- CLT may select the channel to run at the best available part of the spectrum
- Must be very robust to worst case expected channel conditions for the new CNU
- Worst case SNR a modem can support (on the best available part of the spectrum
- Protect against notches in spectrum caused by reflections
 - Plus some margin to protect against spurs
- Probably will not use frequencies subject to known external interference (LTE..)

Protection against burst noise

- PLC is not interleaved with data
- PLC frame is separately spread over multiple symbols
- Codewords need to be long enough to overcome expected burst durations
- Codewords over the PLC frame should not be too long to not increase latency too much

AWGN

- 256-QAM requires an average SNR of 24 dB with no margin
- Worst case attenuation of a group of eight subcarriers due to SCTE 40 reflections is 4 dB
- Assume some margin for worse loops and/or spurs and/or additional margin taken ~ 4 dB
- Target SNR of ~ 16 dB to receive the PLC
- 16-QAM plus FEC with 75% code rate (effective PLC data rate is about 750 kbps with the lowest number of subcarriers)

Burst Noise

- Assume worst case burst noise limits of
 - 16 µs @ 5 dB SNR over two OFDM symbols
 - 10 µs @ 10 dB SNR over two OFDM symbols
- Two OFDM symbols may be impacted by the burst noise

RATE 75% (384,288) LDPC CODE

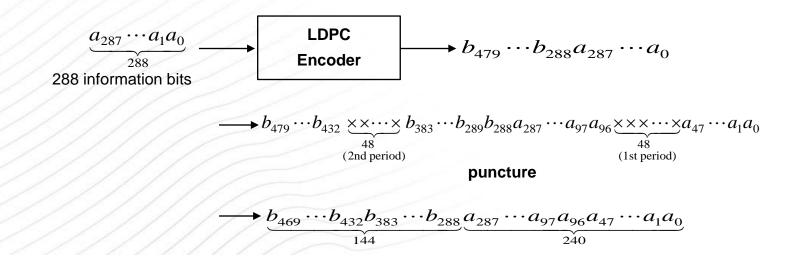

• 75% (384,288) binary punctured LDPC code

- Mother LDPC code: 60% (480,288) code
 - 4x10 base parity check matrix with sub-matrix size (lifting value) equal 48.
 - Parity check matrix

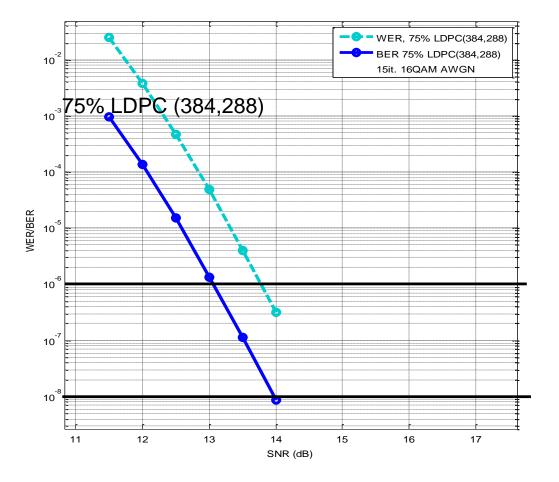

16	1	28	9	40	38	16	-1	-1	-1
28	42	36	11	39	9	8	38	-1	-1
5	2	18	16	25	47	-1	2	19	-1
18	18	40	18	0	34	-1	-1	7	32

- (384, 228) code is obtained by puncturing (480,288) mother code
 - Two period puncturing
 - Period 1: size 48 start at 48 (puncturing information bits)
 - period 2: size 48 start at 384 (puncturing parity bits)

PERFORMANCE ON AWGN CHANNEL

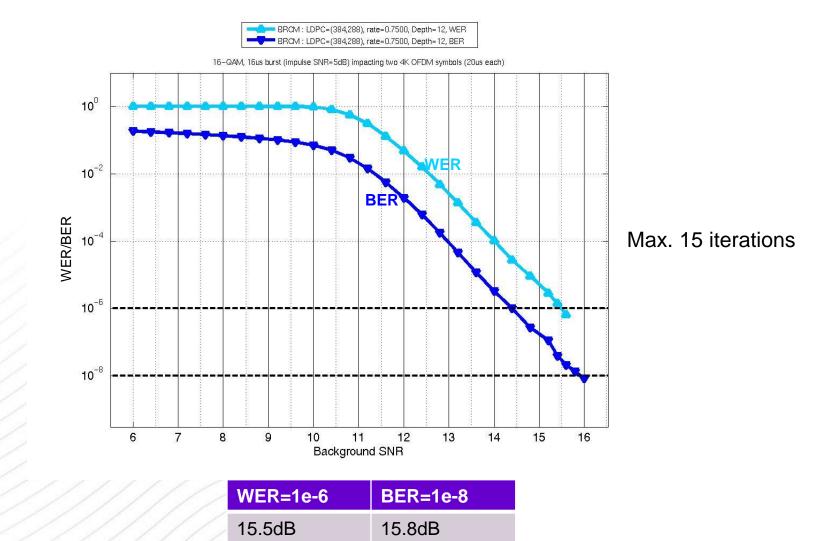

WER=1e-6	BER=1e-8		
13.8dB	14dB		

PERFORMANCE ON IMPULSE/BURST NOISE 16 µs burst with 5 dB burst SNR

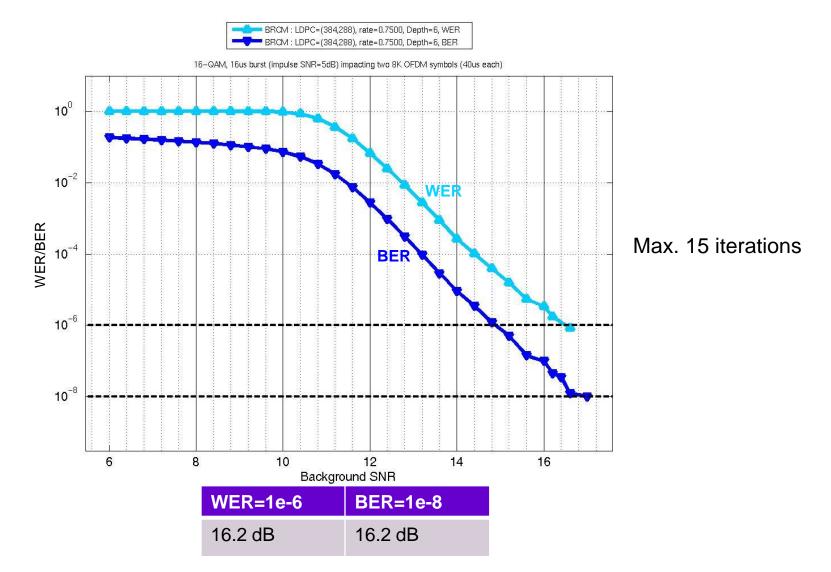

12 symbol latency, Impulse noise impacts two 20 µs symbols

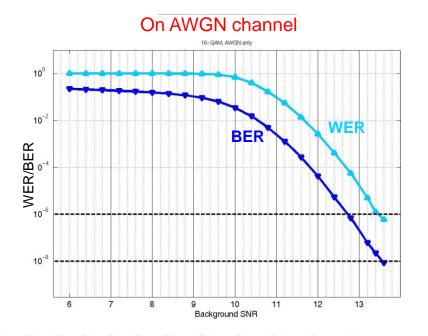

6

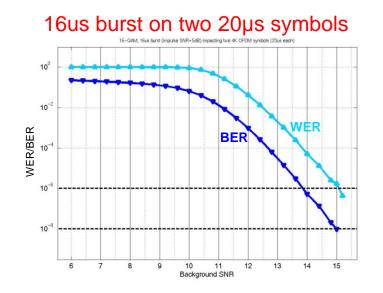

PERFORMANCE ON IMPULSE/BURST NOISE 16 µs burst with 5 dB burst SNR

6 symbol latency, Impulse noise impacts two 40 µs symbols

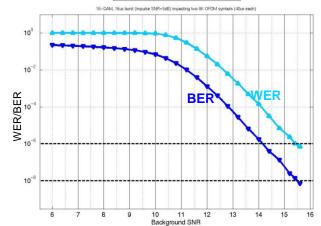

The figures below show the performance with maximum 8 iterations

- BER< 1e-8 SNR = 13.5 dB with AWGN</p>
- BER< 1e-8 SNR = 15.5 dB with burst noise
- 1 dB degradation compared to 15 iterations

An LDPC code for the PLC is proposed

- Code rates: 75%
- Code latency: 270 uSec
- SNR = 13 dB to 16 dB with AWGN and Burst noise
- Complexity negligible (three orders of magnitude lower) compared to the downstream data decoder

Thank You
