

OFDM TX Shaping for 802.3bn

Leo Montreuil

Jan 2013

- TX window is specified as N_t samples in taper region
 - No need for different set of Alpha for 4K and 8K FFT.
 - Avoid confusion for calculation of N_t with variable Cyclic Prefix.
$$\text{Alpha} = N_t/N_{\text{fft}}, \quad T_p = N_t/204.8e6$$
- $N_t = \{0, 32, 64, 128, 256\}$
or $T_p = \{0, 0.15625, 0.3125, 0.625, 1.25\}$ us
 - (Alpha = {0, 0.78125%, 1.5625%, 3.125%, 6.25% } for 4K FFT)
 - (Alpha = {0, 0.390625%, 0.78125%, 1.5625%, 3.125%} for 8K FFT)
- A postfix of N_t samples is added, windowing is applied to cyclic prefix and postfix
 - Windowing is absorbed by CP.
 - Symbol time is independent of Window N_t .
 - Receiver sampling is independent of TX window.
 - TX window appears to RX as post-cursor multipath, affect only the following symbol, not the previous symbol.

Windowing Function

- Raised-Cosine window in frequency domain (FD):

$$P(f) = \left[\frac{\sin(\pi f T)}{\pi f T} \left(\frac{\cos(\pi \alpha f T)}{1 - (2\alpha f T)^2} \right) \right], \quad 0 \leq \alpha \leq 1$$

- Raised-Cosine window in time domain (TD):

$$p(t) = \begin{cases} \frac{1}{T}, & 0 \leq |t| < \frac{T(1-\alpha)}{2} \\ \frac{1}{2T} \left\{ 1 + \cos \left[\frac{\pi}{\alpha T} \left(|t| - \frac{T(1-\alpha)}{2} \right) \right] \right\}, & \frac{T(1-\alpha)}{2} \leq |t| \leq \frac{T(1+\alpha)}{2} \\ 0, & \text{otherwise} \end{cases}$$

Note: $\alpha = 0$ is a rectangular window (no shaping).

Examples of Raised-Cosine Window

MATLAB code for TX window p:

Nfft = 4096;	% FFT size
CP = 256;	% Nb. samples in Cyclic Prefix
Alpha = 1/32;	% RX Alpha
Nt = 2*round(Nfft*Alpha/2);	% Nb. samples in taper region
p = 1/2*(1+cos(pi*[-Nt+1/2:Nt-1/2]/Nt));	% Raised-Cosine in TD
p = [p(1:Nt), ones(1,Nfft+CP-Nt), p(Nt+1:2*Nt)];	% Add ones in middle

Taper Region weight for Alpha = 1/128 (32 points):

0.0006	0.0054	0.0150	0.0292	0.0480	0.0711	0.0984	0.1295
0.1642	0.2022	0.2429	0.2862	0.3316	0.3785	0.4266	0.4755
0.5245	0.5734	0.6215	0.6684	0.7138	0.7571	0.7978	0.8358
0.8705	0.9016	0.9289	0.9520	0.9708	0.9850	0.9946	0.9994

Note: The taper region should not change with different CP → $Nt = \text{Alpha} * Nfft$.

OFDM TX Windowing, RX sampling offset unaffected by TX Windowing

Note: T_s is independent of RC Window Alpha

Leakage Power in Adjacent & In-band 6 MHz Bandwidth

Per Subcarrier FD Response, 4K FFT with Raised-Cosine Window

Per Subcarrier FD Response, 8K FFT with Raised-Cosine Window

Power in 6 MHz BW at Band-Edge with 1.0 MHz Guard Band vs. TX Alpha

Power in 6 MHz BW In-Band with 1.0 MHz Guard Band vs. TX Alpha

Leakage in Spectral Exclusion for SC-QAM after SQRT RC filter

4K FFT, Alpha TX = 1/32, CP = 1.25 μ s, 8 MHz Spectral Exclusion, SC-QAM 5.35 Mbaud

4K & 8K FFT, CP = 1.25 us, 8 MHz Spectral Exclusion, SC-QAM 5.35 Mbaud

Leakage in Spectral Exclusion for Narrow Bandwidth

4K FFT, Alpha TX = 1/32, CP = 1.25 us, 1 MHz spectral exclusion, 0.5 MHz Rectangular Filter

4K FFT, Alpha TX = 1/32, CP = 1.25 us, 2 MHz Spectral Exclusion, 1 MHz Rectangular Filter

4K & 8K FFT, CP = 1.25 us, 1 MHz spectral exclusion, 0.5 MHz Rectangular Filter

4K & 8K FFT, CP = 1.25 us, 2 MHz Spectral Exclusion, 1 MHz Rectangular Filter

Thank You
