

Congestion Management Protocols More QCN Simulation Results

Guenter Roeck, Teak Technologies

July 2007

Simulation Parameters

Traffic

- Bernoulli
- Uniform destination distribution
- 1500 byte frames

System

- Switch latency (processing time) = 1us
- Link latency = 500ns
- Switch frame capacity = 1,400 packets (2.1MB)
- No PAUSE generated by switch
- Egress buffer size 5,000 packets (7.5MB)

ECM

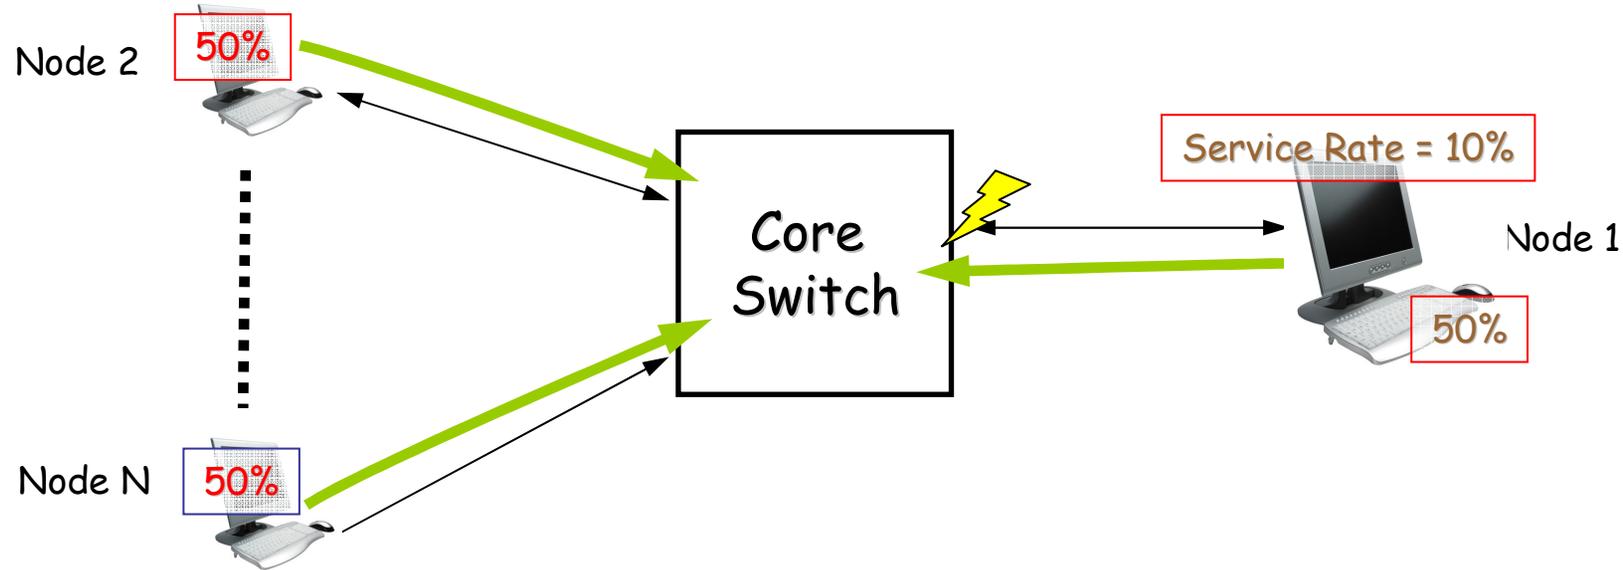

- $W = 2.0$
- $Q_{eq} = 37.5\text{kB}$
- $G_d = 0.5 / ((2 * W + 1) * Q_{eq})$
- $G_i = 0.1 * (R_{link}/R_{unit}) / ((2 * W + 1) * Q_{eq})$
- $P_{sample} = 2\%$
- $R_{unit} = R_{min} = 1 \text{ Mb/s}$
- BCN_MAX enabled

- QCN
 - Drift factor = 1.005
 - Timer period = 500 uS
 - Extra fast recovery enabled
 - EFR MAX disabled
 - A = 3 mbps
 - Fast Recovery Threshold = 5
 - Gd = 1/128
 - TO_THRESH = 75 kBytes
 - Qeq = 37.5kB
 - **Hyperactive Increase disabled**
 - **Psample = 1.2% (fixed)**
- QCN – 2nd set of parameters
 - **Hyperactive Increase enabled**
 - **Psample = 1% .. 10% (variable with level of congestion)**

Scenario 3: Output Generated Single Hotspot

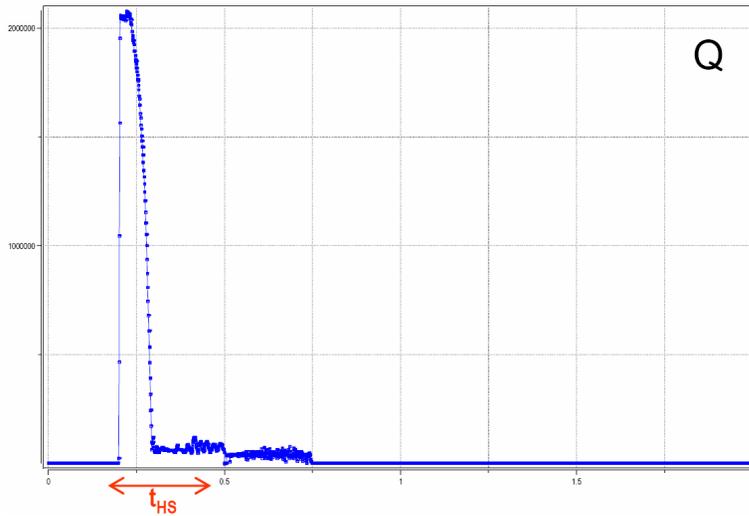

- All nodes (16): Uniform distribution, load: 5 Gb/s
- Node 1 (hotspot) service rate: 1Gb/s
- One congestion point
 - Duration: 300 mS from $t_i=200$ ms to 500 ms
- Simulation runtime: 2 seconds

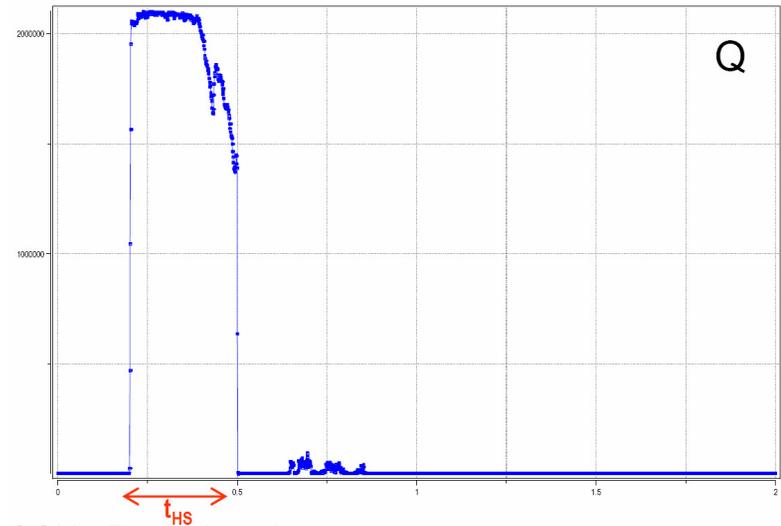

Scenario 3: Queue Length

Scenario 3: Data Rate

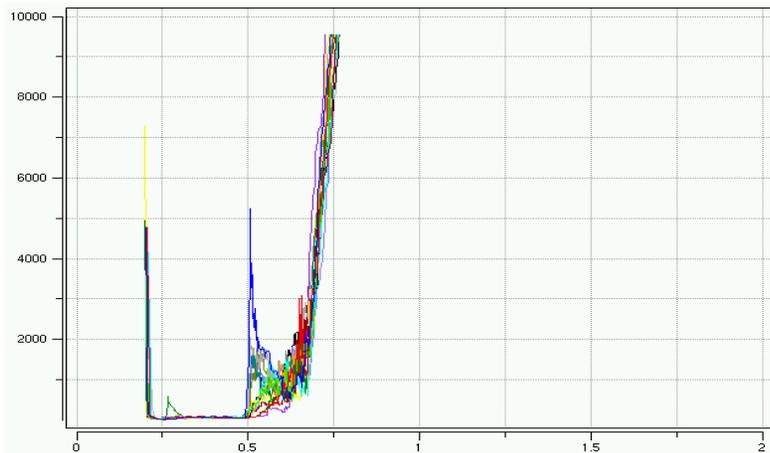

ECM - ZRL

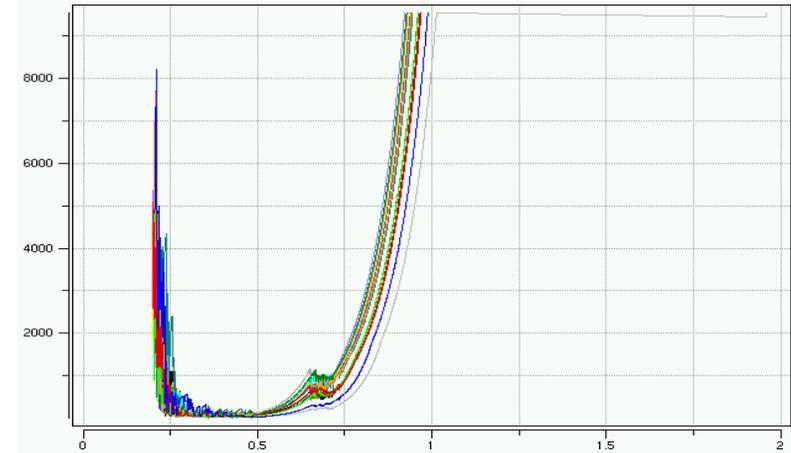

QCN - ZRL

QCN - 2nd parameter set

QCN-P

- QCN fails with fixed probe interval
 - Higher increase rate on recovery requires higher (flexible) decrease rate
 - If probe interval is too low ($<1.2\%$), QCN never recovers
- QCN reacts faster with Hyperactive Increase enabled
- Should run QCN simulations with variable probe interval and (possibly) hyperactive increase
