

PBB-TE ESP

1:1 Protection Switching

David W. Martin
Nortel Networks
v03

IEEE 802.1
September 4-7, 2007
Stockholm

Agenda

- **Recap From July Plenary**
- **Simple PBB-TE ESP 1:1 Protection**
- **Mapping To PBB-TE CBP Model**

PBB-TE
IEEE P802.1Qay

Recap From July Plenary

➤ Two protection switching presentations:

- **ay-martin-protection-0707**
 - general overview of 1:1 protection and G.8031
- **ay-zehavit-scope-and-protection-0707**
 - 1:1 protection using CCMs with RDI flag

➤ Discussion items:

- Are both directions of a protected ESP co-routed?
- Is protection uni-directional or bi-directional?
- Is revertive or non-revertive mode used?
- Should the G.8031 1:1 APS protocol be leveraged?
- Are operator requests supported?

Recap From July Plenary

- In general there appeared to be support for a simple single phase 1:1 protection approach
- The following slides pursue that direction

PBB-TE
IEEE P802.1Qay

Simple PBB-TE ESP 1:1 Protection

- Requirements assumptions
- Switching example walkthrough
 - Normal state
 - Transition during fault
 - Protected state
- Checklist

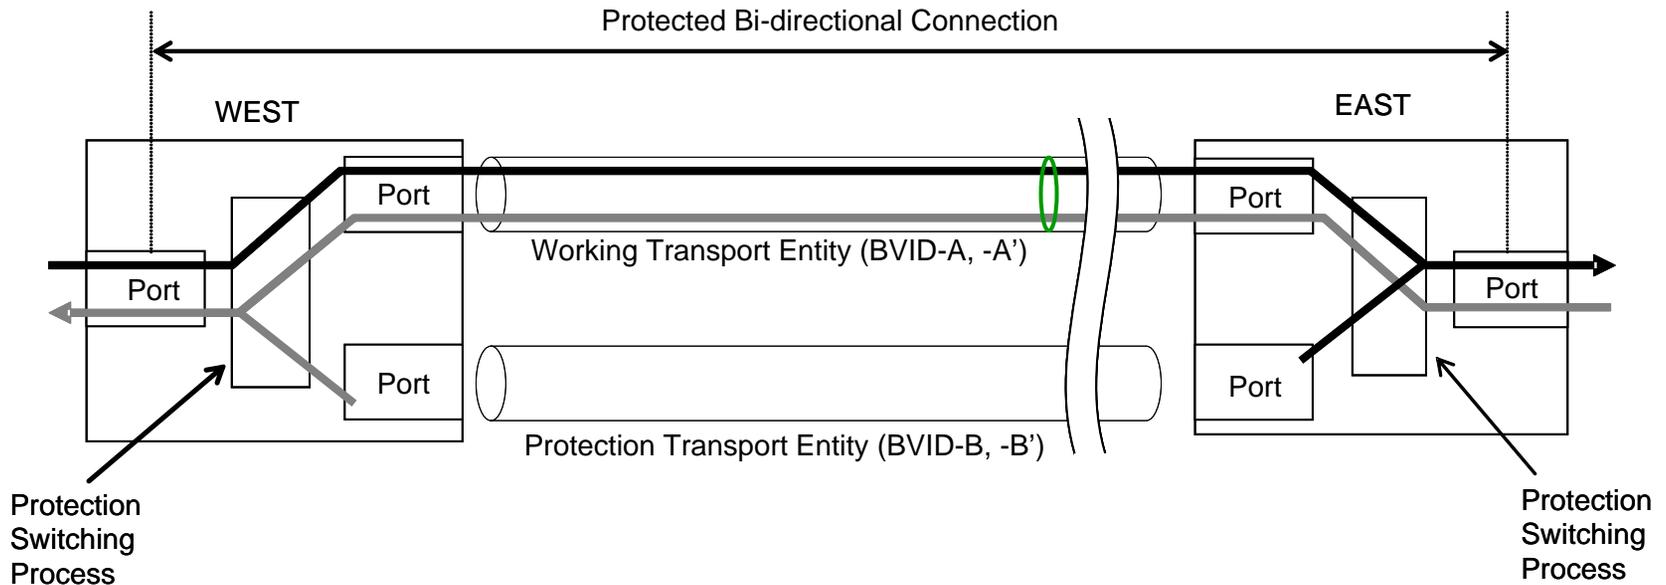

PBB-TE
IEEE P802.1Qay

Requirements Assumptions

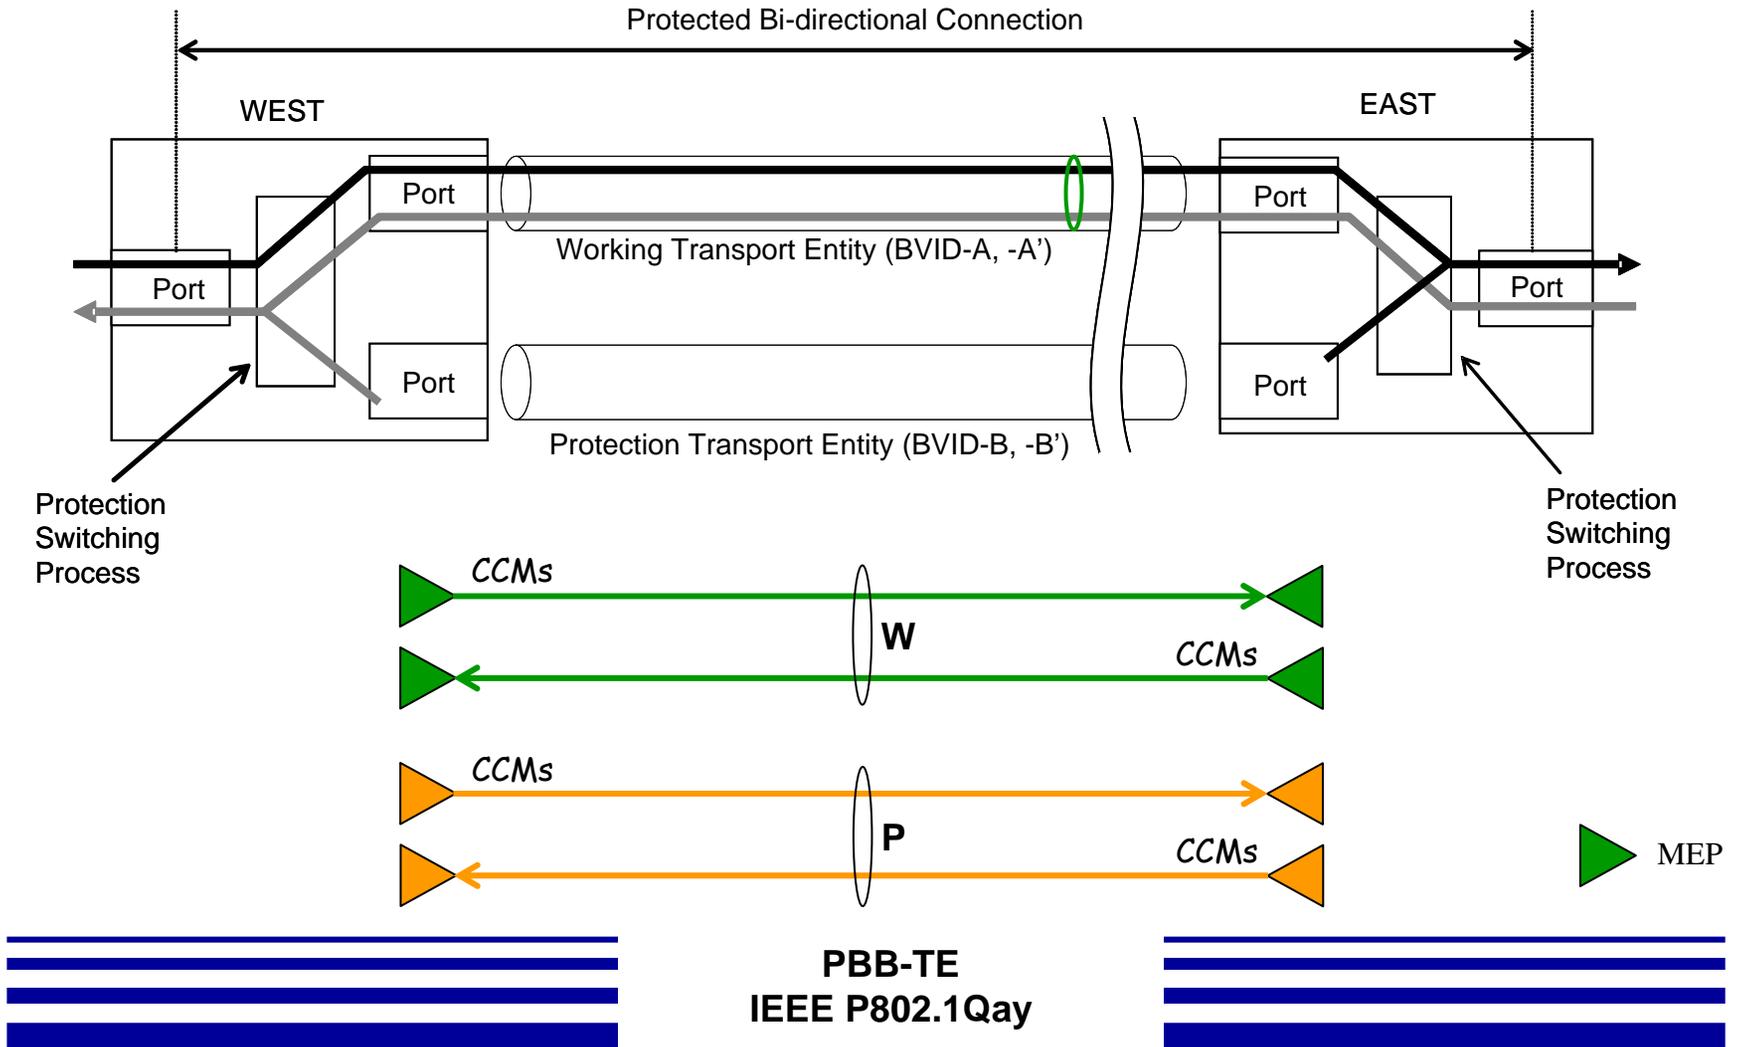

- The protected domain extent is CBP-CBP
- A uni-directional ESP is identified by <DA, SA, B-VID>
- A trunk is a pair of uni-directional ESPs
- Bi-directional switching
 - Helps avoid operations errors
- Revertive or Non-revertive mode
 - Operational preference
- Lightweight APS protocol
 - Operator requests are handled by Management action rather than via protection signalling

1:1 Bi-Directional Mode: Normal

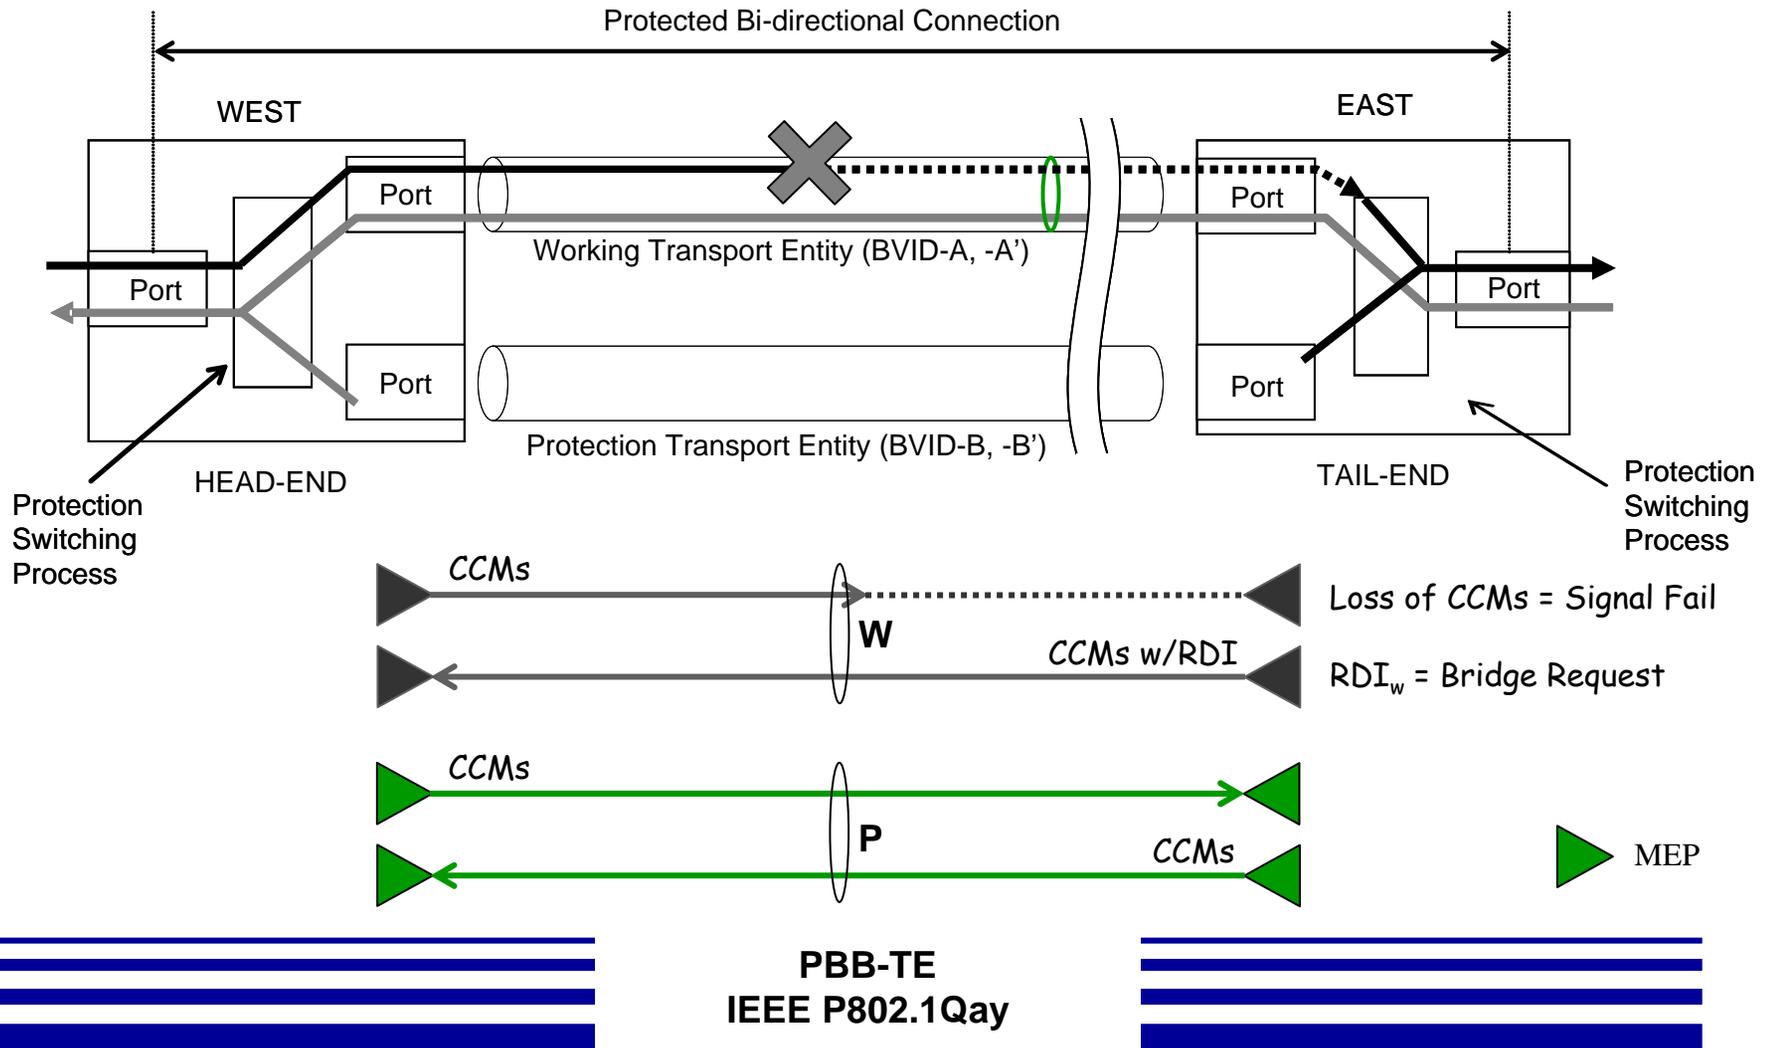

- Note the use of a Merging Selector, where frames from both W and P are received (refer to G.870 c3.2.97.2)

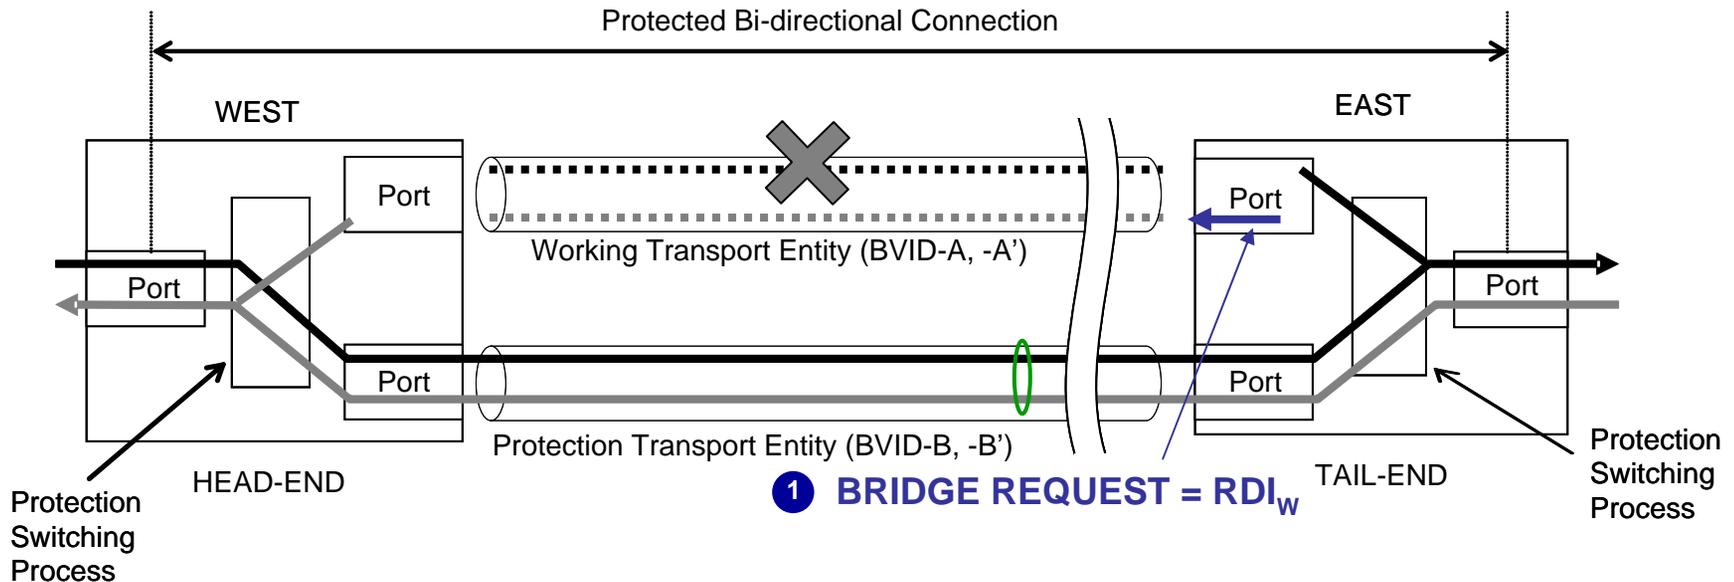

1:1 Bi-Directional Mode: Normal

Simplified Single Phase Protection

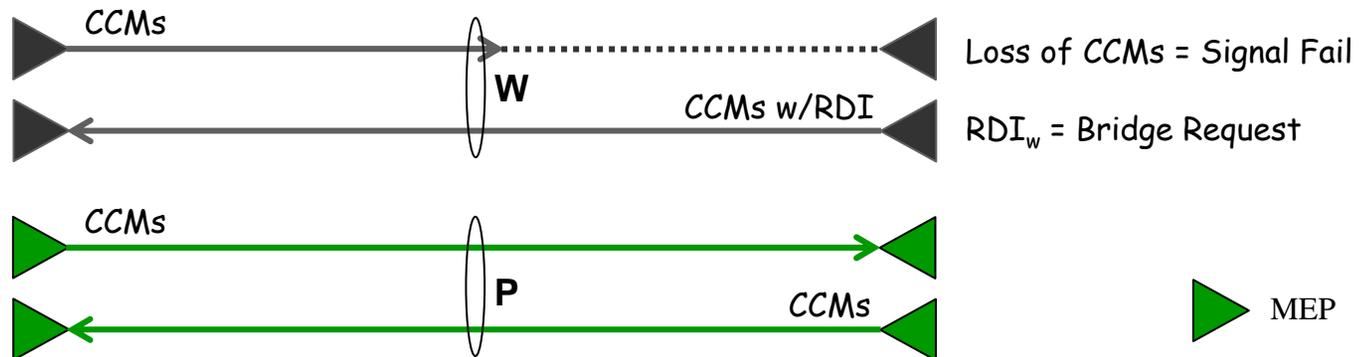

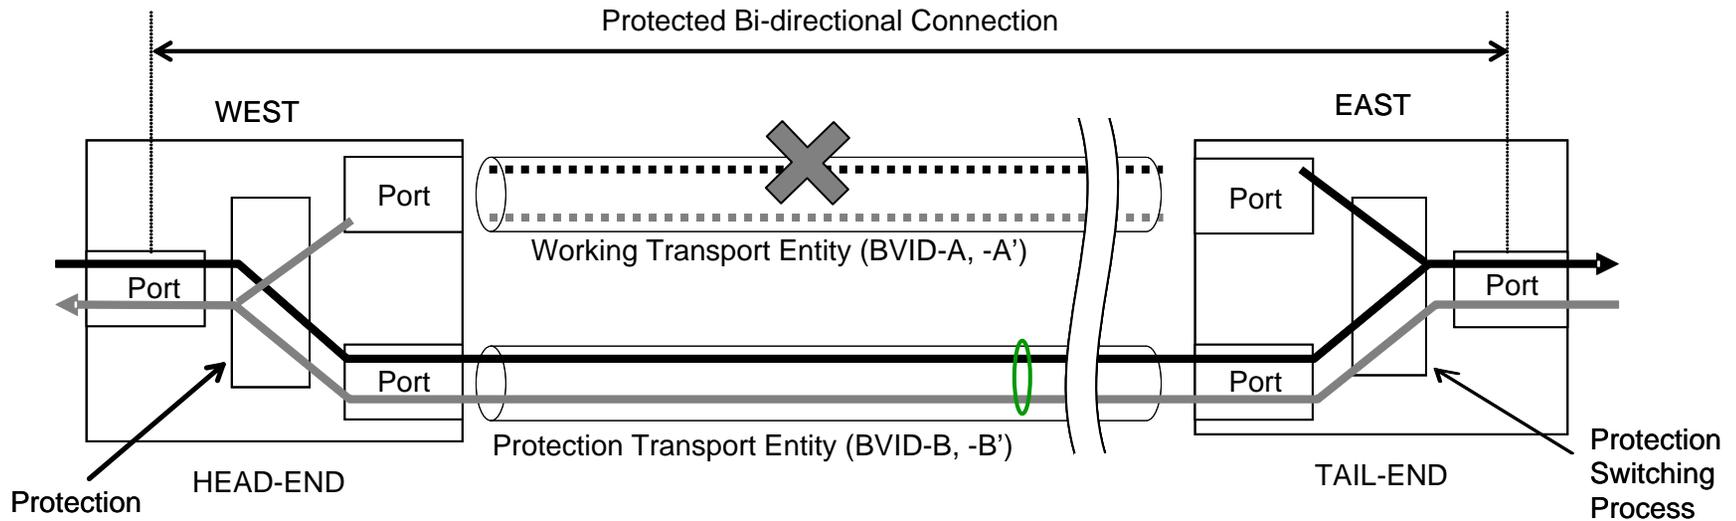

Simplified Single Phase Protection

- Tail-end signals Bridge Request to head-end and operates its Selector Bridge (where frames are only transmitted on P - refer to G.870 c3.2.11.3).
- Head-end operates its Selector Bridge upon reception of Bridge Request

PBB-TE
IEEE P802.1Qay

1:1 Bi-Directional Mode: Protected

PBB-TE
IEEE P802.1Qay

Protection Checklist

- **Have the basic elements of a protection scheme been addressed?**
 - Triggers (detect time): Loss of CCMs**
 - Bridge mechanism: Selector bridge**
 - Selector mechanism: Merging selector**
 - Protection phases (completion time): Single**
 - Signalling: RDI flag**
- **Is the signalling complete?**
- **Cross-check against a fully featured list...**

Signalling Info Checklist

Request/State	1111	Lockout of Protection (LO)	Priority	→ N/A (operator requests via Mgmt)
	1110	Signal Fail for Protection (SF-P)	highest	→ RDI flag in CCMs on P
	1101	Forced Switch (FS)		→ N/A (operator requests via Mgmt)
	1011	Signal Fail for Working (SF)		→ RDI flag in CCMs on W
	1001	Signal Degrade (SD) (Note 1)		→ N/A
	0111	Manual Switch (MS)		→ N/A (operator requests via Mgmt)
	0101	Wait to Restore (WTR)		→ Could use local (hidden) timer
	0100	Exercise (EXER)		→ N/A (operator requests via Mgmt)
	0010	Reverse Request (RR)		→ N/A (always bi-directional mode)
	0001	Do Not Revert (DNR)		→ Could use infinite WTR value
	0000	No Request (NR)	lowest	→ Absence of RDI flag in CCMs
	Others	Reserved for future international standardization		
NOTE 1 – SD is for further study.				

From Table 11-1 / G.8031

- An internal Wait-to-Restore timer can be used to decouple the CFM behaviour (i.e., CCM, RDI exchanges) from the protection processing / actions

IEEE P802.1Qay

Signalling Info Checklist

Protection Type	A	0	No APS Channel	→
		1	APS Channel	
	B	0	1+1 (Permanent Bridge)	
		1	1:1 (no Permanent Bridge)	→
	D	0	Unidirectional switching	
		1	Bidirectional switching	→
	R	0	Non-revertive operation	
		1	Revertive operation	→

Fixed parameters
No need to signal

Requested Signal	0	Null Signal	
	1	Normal Traffic Signal	→
	2-255	(Reserved for future use)	

Single W channel
Inherently indicated by MEP

Bridged Signal	0	Null Signal	
	1	Normal Traffic Signal	→
	2-255	(Reserved for future use)	

Single W channel
Indicated by B-VID

Protection Checklist

- **Have the basic elements of a protection scheme been addressed?**
 - ☑ **Triggers: Loss of CCMs**
 - ☑ **Bridge mechanism: Selector bridge**
 - ☑ **Selector mechanism: Merging selector**
 - ☑ **Protection phases: Single**
 - ☑ **Signalling: RDI flag**
- **Yes**

Possible PBB-TE CBP Model

PBB-TE
IEEE P802.1Qay

Possible PBB-TE CBP Model (cont'd)

- TX Direction: APS Shim steers data frames with BVID=1 over either W (BVID=1) or P, replacing frame BVIDs (1) with BVID=12
- RX Direction: APS Shim combines data frames from W and P, replacing P frame BVIDs (12) with BVID=1
