# DCB for Network Virtualization Overlays

Rakesh Sharma, IBM Austin  
IEEE 802 Plenary, Nov 2013, Dallas, TX

# What is SDN? ↑↑

---

- **“Stanford-Defined Networking”**
- **“Software-Defined Networking”**
- **“Sexy-Defined Networking – Networking is cool again”**
- **“Isn’t it OpenFlow? Or is it Network Virtualization **Overlay Network** e.g. **VxLAN** and **NvGRE**?”**
- **“Oh Yeah we’re building an SDN Chip”**
- **“Hmm... Still Don’t Know!”**

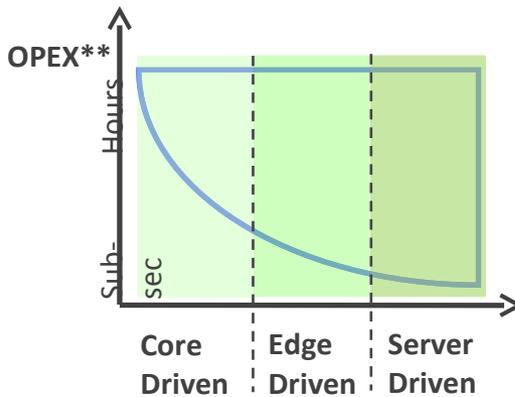

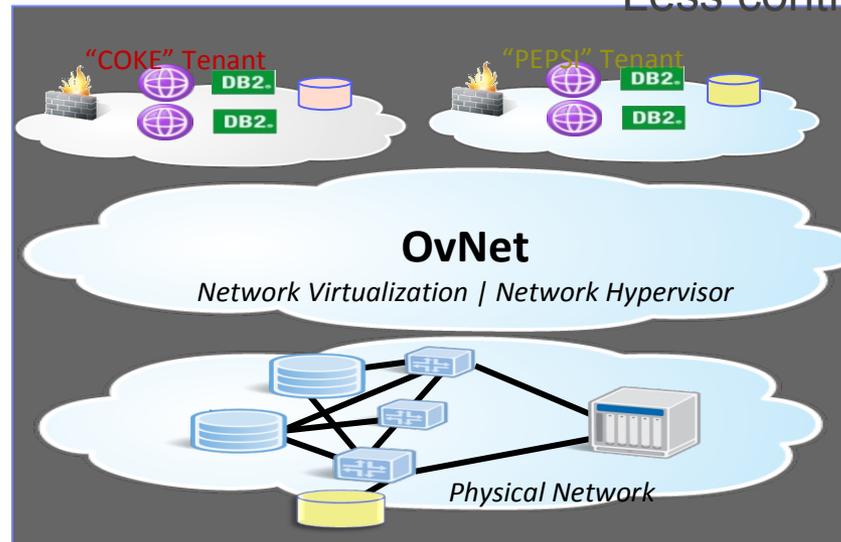

*Reference: Adapted from: Jayshree Ullal of Arista’s Chart....*

# Summary of OvNet Value

- **Wire-once / Configure-once physical network within & across DCs**
  - Server Software virtualizes physical network
  - Physical network becomes simple interconnect

## Extreme scale (Lower CAPEX)

- Server computing is cheaper
- Cheaper physical network (smaller tables)
- Less control load on network

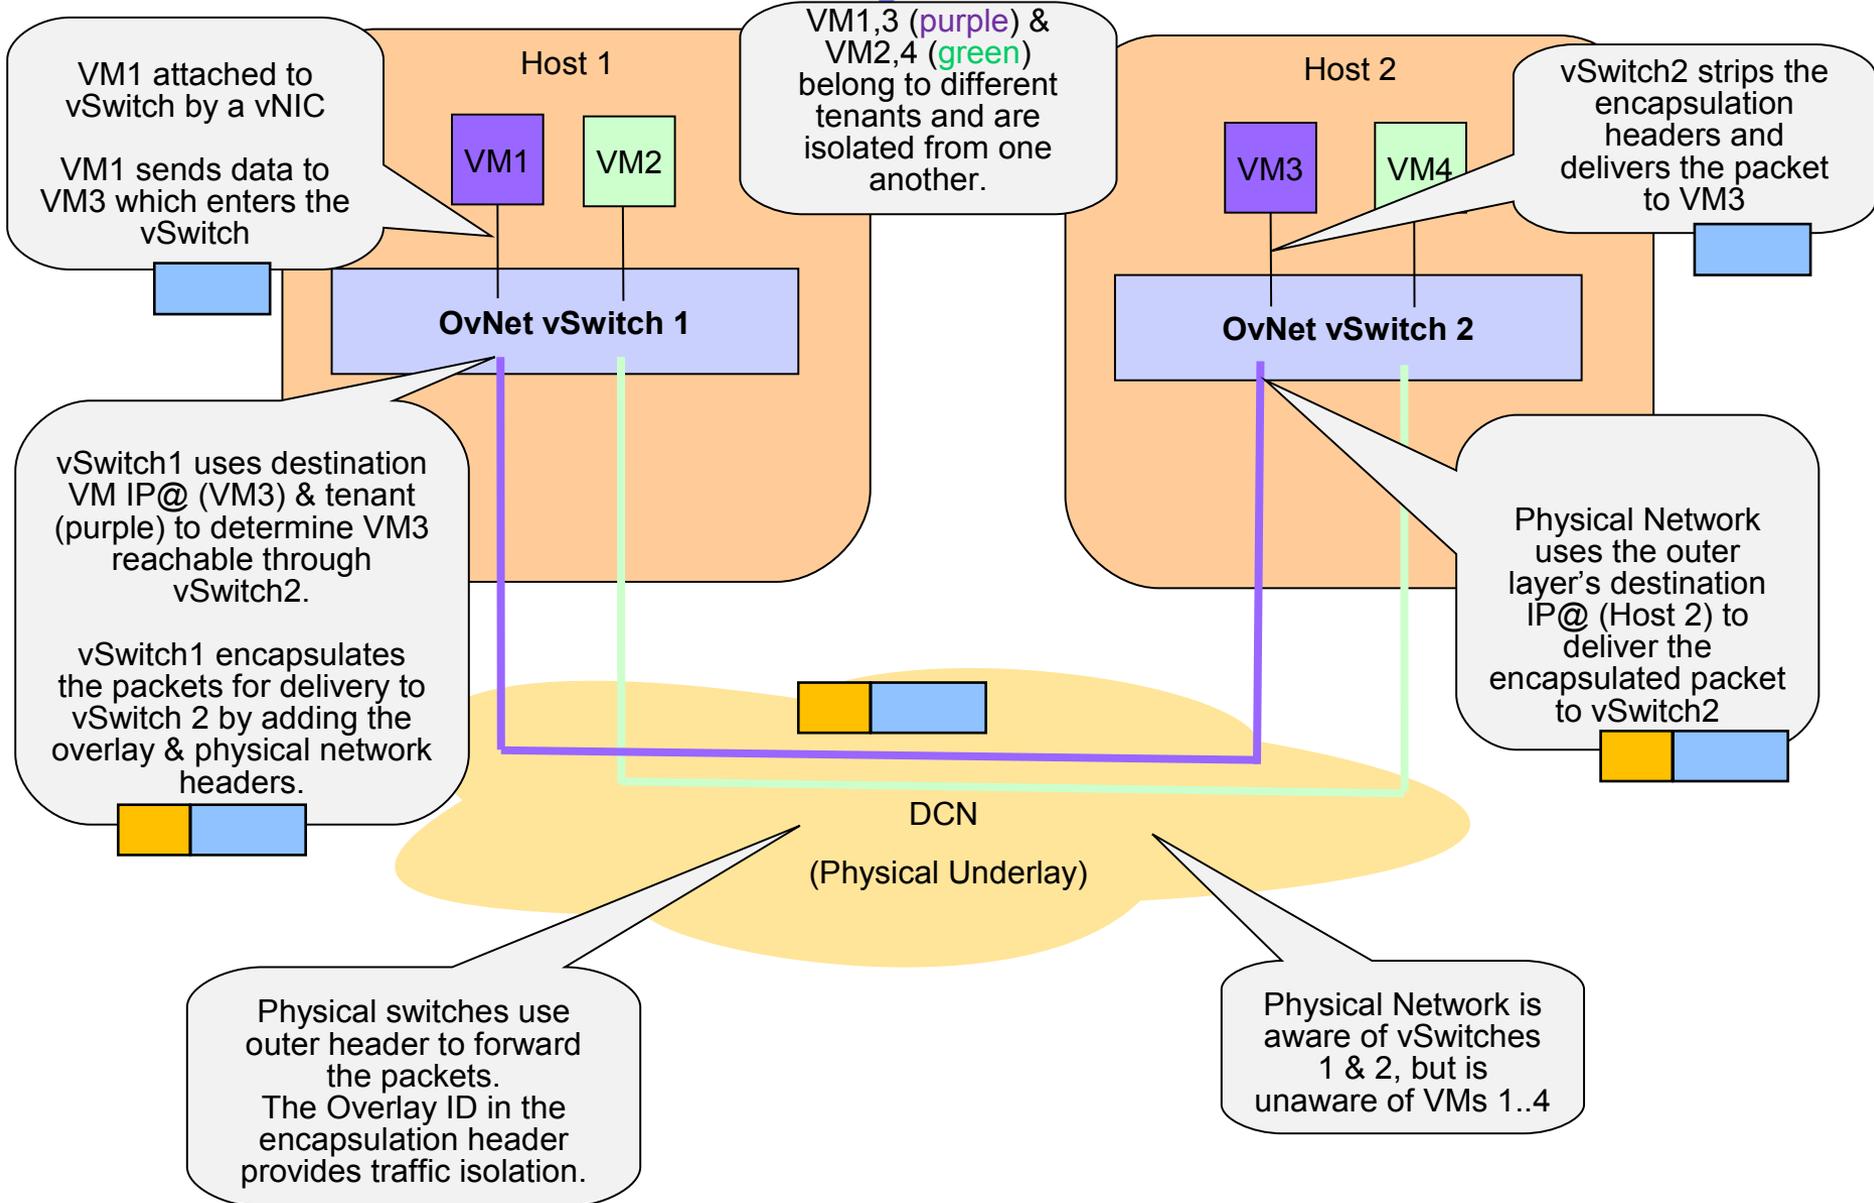

\*\* Effort & Time to configure a network based on workload changes

- **Single dashboard view across all tenants (Lower OpEx)**
  - Comprehensive monitoring
  - Easier reporting and billing
- **Aligns roles and work in the data center (Lower OpEx)**

- **Dynamic provisioning (Lower OPEX)**
  - Multi-tenant, layer-3 network all the way to the VM
  - Easy sharing of network resources
  - Distributed network & security applications above overlay

# OvNet Overlay Network

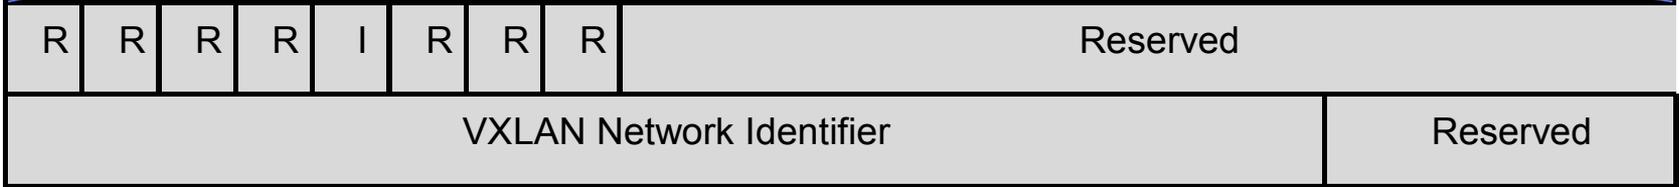

# OvNet Encapsulation - VXLAN based Example

Original Packet

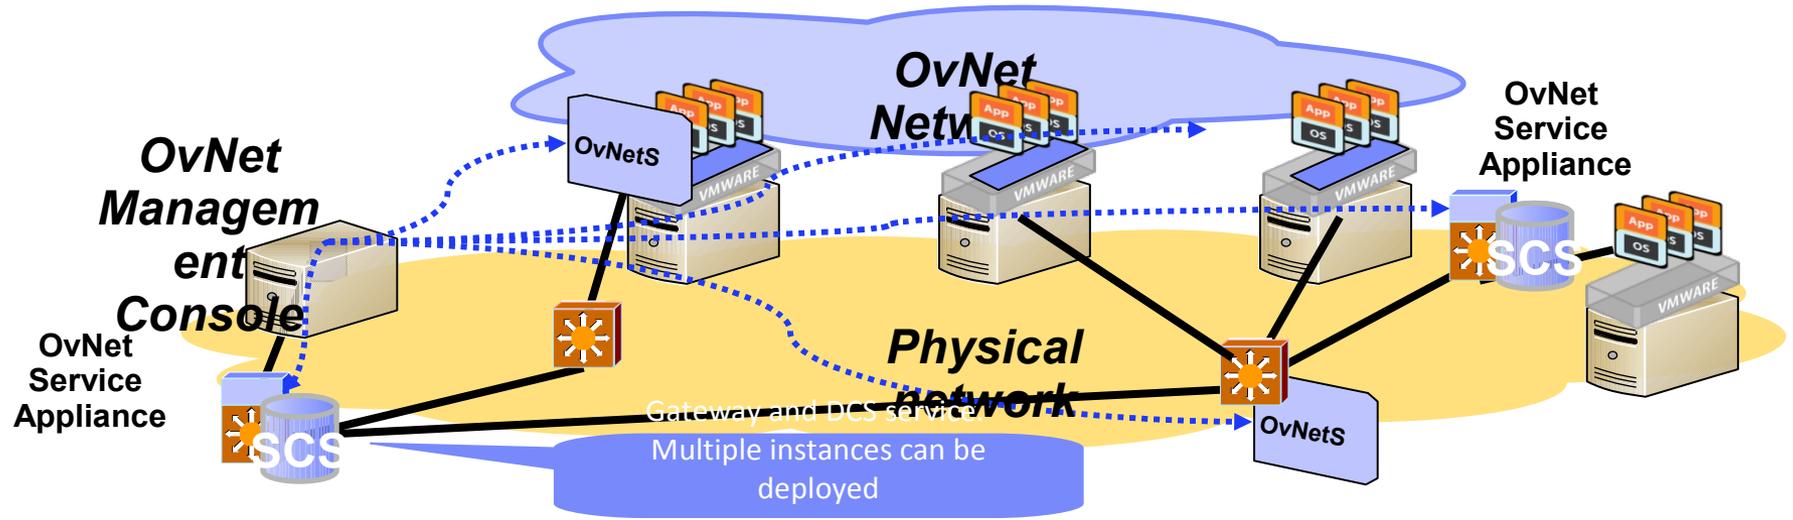

Encapsulation

Encapsulation Protocol (EP) Header (e.g. VXLAN based)

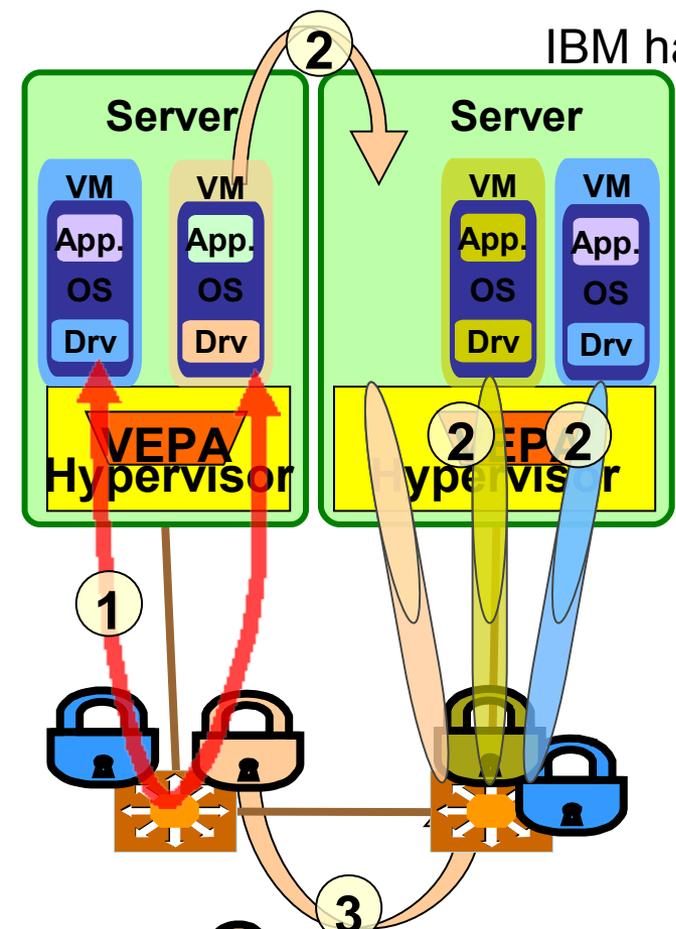

# OvNet Network Technology Components

- **OvNet Management Console**
  - Provides GUI and APIs for management of OvNet network, groups and policies
- **OvNet Switches (OvNetS)**
  - Provides UDP based overlay (header format same as VXLAN)
  - Performs data and some control plane functions
  - **Embedded in Servers (as vSwitch) or in Access Switches or EOR/Aggregation switches.**
- **OvNet Service Appliance**
  - **Distributed Connectivity Service (DCS):**
    - discovers & disseminates VM location (physical server)
    - maintains policy (e.g. allow, deny, insert service appliance) and works with OvNet switches to apply policy
  - **Gateway Service: Connectivity to non-OvNet networks**

# Ethernet EVB Standards (IEEE 802.1Qbg)

IBM has driven automated network state migration standards:

## 1. Ethernet Virtual Bridging (EVB) Protocol

- Defines where VM-VM communication is performed:
  - Within server through Virtual Ethernet Bridge (VEB); or
  - By external switch, through Virtual Ethernet Port Aggregator (VEPA).

## 2. Multi-channel Protocol

(e.g. IBM's pre-standard Virtual Fabric)

- Allows a mix of internal (VEB) and external (VEPA) based switching approaches on the same server physical port.

## 3. Virtual Station Interface (VSI) Discovery Protocol (VDP)

- Automates creation, migration and removal of network state that is associated with a Virtual Machine.
- Enables port profiles to dynamically migrate with a VM when that VM migrates.

A Port Profile (a.k.a. VSI Type) consists of network state associated with the VM, (e.g. Access, QoS & Security Controls).  
Note: VDP also associates a VLAN ID with the VM.

# IEEE 802.1Qbg/BR Enhancement Proposal

---

## ▪ Motivation

- SDN Overlay Networking has tremendous value proposition.
- OvNet has large mindshare, customer attractiveness and industry momentum
- IEEE 802.1Qbg and IEEE 802.1BR standardize EVB, multi-channel and VDP.
- IEEE 802.1Qbg and IEEE 802.1BR currently unaware of OvNet
- IEEE 802.1Qbg and IEEE 802.1BR will bring number of advantages to OvNet
  - Configuration Automation of adjacent bridges
  - Exploit Adjacent Bridge capabilities (ACLs, QoS, Traffic Monitoring, Shaping etc.)

## ▪ Proposal

- Small updates to IEEE 802.1Qbg/IEEE 802.1BR to accommodate Overlays
- These updates should support:
  - When OvNet encapsulation/de-encapsulation is occurring in the station embedded EVB and
  - When OvNet encapsulation/de-encapsulation is occurring in the adjacent bridge.
- Update EVB TLVs to support OvNet capable vSwitches.
- Update VDP TLVs to support VN (Virtual Network) Identification and Encapsulation Type.
- Others
