Link aggregation with TSN

Marius Stanica, ABB
Use Case. High amount of events support
Link aggregation

• A high amount of exception reports may be created from various functional units and trying to reach a server (i.e. Operations)

• It would be useful to be able to do link aggregation, in such a case, as one may not really need to change the backbone bridges

• One may advocate the usage of very high end bridges with high bandwidth, but this must not always be the case, we should allow various choices
Use Case. Event-based control

End Station (controller)

Bridge

End Station (controller)

Stream1

Stream2

Stream3
