FOREWORD

<< Contributor's notes:

This document has been contributed to the IEC/IEEE 60802 Joint Project via the 1st Task Group ballot on D1.0.

The only intention with this document is to outline some potential slight restructuring of the Draft for consideration for the group.

The intention behind the proposal is to improve clarity and readability of the Draft (improve the "flow" of the Draft.)

No rewrite is suggested by this contribution.

The contributor has submitted separate ballot comments with respect to the content of the Draft.

This contribution only focuses on the structure. The content aimed to be kept the same as D1.0, with some illustrative suggested new text in some of the suggested new clauses. However, restructuring and reformatting may provide a different look. Furthermore, some introductory text is suggested at the beginning of some of the clauses to aid the flow of reading.

In order to make it clearer that this is just an individual contribution not and IEC/IEEE 60802 Draft, the FOREWORD has been replaced with this explanation and the INTRODUCTION has been removed.

Proper cross-references were used in the contribution; however, the final outcome is not under the control of the contributor.

This commenter suggests two restructuring steps. This version of the contribution includes both Step 1 and Step 2.

Step 1: Structure

Different kind of requirements could be distinguished clearer. There are conformance requirements. There are requirements coming from Industrial Automation being the target, e.g., from the characteristics of control loops etc. All kinds of requirements are in Clause 6 in D1.0. It would be good to have the conformance and other kind of requirements in separate Clauses.

The Conformance Clause will be not part of the "reading flow" of the document anyways, so it would be good to have it before or after the descriptive clauses. As the Conformance Clause can give orientation to the reader, this commenter suggests having the Conformance Clause right after the terms and definitions, i.e., as Clause 4.

The "Overview of TSN for Industrial Automation" Clause could be Clause 5, i.e., follow Clause 4 Conformance.

The requirements coming from the nature of Industrial Automation, could be part of Clause 5 Overview of TSN for Industrial Automation, because they are closely related to what is Industrial Automation. With that the title of Clause 5 could be "Industrial Automation" with subclauses 5.1 Overview and 5.2 Requirements and an introductory text before 5.1. Thus, Clause 5 would give input to the rest of the document, e.g., to verbal description of industrial profile(s).

If textual description will be provided for the Industrial Automation profile, then it is suggested to be Clause 6. This contribution assumes a single profile. Clause 6 should be sub-divided in case of multiple profiles.

supporting ballot comment on 60802/D1.0 - 5 - Step 1 & 2

Step 2: Conformance

Step 2 intends to improve conformance statements. Content of D1.0 was not intended to be changed. However, some additions have been made as part of the improvement attempt. Difference, mistakes in this contribution are because the difficulties this commenter had to figure out conformance statements from D1.0.

This contribution assumes a single profile. Additional conformance statements are needed in case of multiple profiles.

Conformance statements in Clause 6 of D1.0 are ambiguous, not precise. Conformance statements should be precise. There should be conformance statements relatively easy to read for a human being. This commenter considers D1.0 Annex A PCS machine-readable, or very close, from which it is an easy step to create further machine-readable formats at the end of the project. However, conformance statements in Clause 6 D1.0 are not friendly to a human reader because it is very difficult to figure out for a vendor what actually needs to be implemented.

It is not possible to refer to entries of tables in D1.0. For instance, in D1.0, the PCS can only refer to subclause or table number but not the specific entry that is meant. This proposal resolves the referencing issue.

For instance, if a vendor only implements end stations, then it is very difficult to figure out what must be implemented. The difficulty is the same for a bridge vendor. This reader ended up needing to open the referred standards to figure it out despite of trying various other method beforehand.

One of the methods this reader tied to figure out what needs to be implemented in case of being a bride vendor.

- 1) Check the mandatory features for bridges in Annex A PCS of D1.0
- 2) Follow the references provided by the PCS items

It is understood that it is an early draft, references are not filled. However, references are not helpful in most of the cases.

For instance, Annex A.4.6 Major capabilities—Bridges refers to subclause 6.2.1.1 General required Bridge features, which however, includes end station features as well. For example, B-Q-1 makes subclause 5.4 of IEEE Std 802.1Q mandatory; however, other conformance statements make some parts of subclause 5.4 of IEEE Std 802.1 optional. Furthermore, Annex A.4.6 just refers to Table 9 in 6.2.1.1 for all the mandatory and optional features. Nonetheless, Table 9 includes both mandatory and optional features, as well as features that are not relevant for IEC/IEEE 60802 at all. Thus, the reader is left out to figure it out from Table 9. Nevertheless, Table 9 is confusing. For instance, makes subclause 5.4 of IEEE Std 802.1Q mandatory in its second entry; but further entries claim some subclauses with 5.4.1 optional or even irrelevant.

Another example is that it is not clear in D1.0 whether or not time synchronization must be supported in all kinds of deployment, or is it optional as it only needs to be supported in some cases, therefore, it is overall optional; but certain aspects must be supported if conformance claim for synchronization support has been made. The difference between bridges and end stations is not clear in D1.0 with respect to what synchronization features must be supported and what are the optional features. Therefore, in this contribution, support for synchronization has been interpreted as an optional feature overall based on the rightmost column of Table 5 in D1.0. Thus, the conformance statements in this contribution try to capture based on D1.0 what is mandatory and what is optional if support for synchronization is claimed (which is optional overall). Note that if synchronization is mandatory overall, then the structure of synchronization conformance statements can be simplified.

- 6 - supporting ballot comment on 60802/D1.0 Step 1 & 2 & 3

The structure suggested in this contribution makes it very clear what a vendor needs to implement.

A bridge vendor claiming conformance to IEC/IEEE 60802:

- must implement subclauses 4.3.1, 4.3.2, 4.5.1, and 4.5.2 in all cases and must implement 4.3.3 and 4.5.3 if support for synchronization is claimed;
- may optionally implement subclauses 4.4 and 4.6.

An end station vendor claiming conformance to IEC/IEEE 60802:

- must implement subclauses 4.3.1, 4.3.2, and 4.7 in all cases and must implement 4.3.3 if support for synchronization is claimed;
- may optionally implement subclauses 4.4 and 4.8.

Furthermore, referencing from the PCS to the corresponding conformance is clear and unambiguous, see, e.g.,: BGE-1 to BGE-8, B-Q-1, or B-Q-2.

Note that the structure of Clause 4 may become simpler if different approach is taken for synchronization. This contribution is intended to illustrate the complex case. Note also that this contribution is just a fist attempt, further improvements are expected if this approach gets applied in the Draft.

Note also that this commenter suggests distinguishing whether an optional feature in a standard (or a complete standard) is irrelevant or an optional feature needs to be excluded. If an optional feature needs to be excluded or options should be specified further, then IEC/IEEE 60802 should provide the reference and specify what to do with it. This commenter considers unnecessary to mention standards or options that are irrelevant for IEC/IEEE 60802. Thus, statements introduced like "implementation for which a claim of conformance to support ... is made does not need to support" and "implementation that conforms to the provisions of this standard does not need to" could be removed. (They are only there in this contributing to maintain the content of D1.0)

Step 3: Mandatory Time Sync

In Step 3, time synchronization has been made mandatory. It simplifies the structure of the conformance clause, i.e., in this contribution. (In step 2, time synchronization was optional because this contributor could not figure out from D1.0 whether time synchronization is mandatory or optional. Optional is more complicated for crafting conformance statements.)

Clarification text has been added that no need to support standards or parts of standards that are irrelevant, therefore, no need to be mentioned.

Time-sensitive networking profile for industrial automation

5

Scope 1 6

This standard defines time-sensitive networking profiles for industrial automation. The profiles 7 select features, options, configurations, defaults, protocols, and procedures of bridges, end 8 stations, and LANs to build industrial automation networks. 9

IA Industrial automation

TSN-IA Time-Sensitive Networking for Industrial Automation

90 3.4 Conventions

91

92 3.4.1 Convention for Capitalizations

Capitalized terms are either based on the rules given in the ISO/IEC Directives Part 2 or emphasize that these terms have a specific meaning throughout this document.

- 95 The following capitalized terms are used:
- 96 Bridge
- 97 Ethernet
- 98 Internet
- 99 Universal Time
- 100 Working Clock
- 101
- 102 Parameter names are capitalized for example
- 103 MinimumFrameMemory
- 104 NetworkCycleTime
- 105 NetworkCycle

- 6 - supporting ballot comment on 60802/D1.0 Step 1 & 2 & 3

- 106 Phase
- 107 ReductionRatio
- 108 Sequence.

109

110 **3.4.2 Unit conventions**

- 111 This document uses
- 112 Tbps for Tbit/s
- 113 Gbps for Gbit/s and
- 114 Mbps for Mbit/s.

This form is used by IEEE 802.3 and as this document is a profile to IEEE 802, it is better readable and consistent.

117 **4 Conformance**

A claim of conformance to this standard is a claim that the behavior of an implementation of a bridge (X.X, X.X) or of an end station (X.X, X.X) meets the mandatory requirements of this standard and may support options identified in this standard.

Bridge and end station implementations for which a claim of conformance to this standard is made do not need to support standards and the parts of standards that are not mentioned in this standard. Bridge and end station implementations for which a claim of conformance to this standard is made shall or may support only the standards referred from this Clause as specified by this Clause.

126 4.1 Requirements Terminology

127 Conformance requirements placed upon conformant implementations of this standard are 128 expressed using the following terminology:

- a) **Shall** is used for mandatory requirements;
- b) **May** is used to describe implementation or administrative choices ("may" means "is permitted to," and hence, "may" and "may not" mean precisely the same thing);
- c) **Should** is used for recommended choices (the behaviors described by "should" and "should not" are both permissible but not equally desirable choices).

The Profile Conformance Statement (PCS) proformas (see Annex A) reflect the occurrences of the words "shall," "may," and "should" within this document.

The standard avoids needless repetition and apparent duplication of its formal requirements by using *is*, *is not*, *are*, and *are not* for definitions and the logical consequences of conformant behavior. Behavior that is permitted but is neither always required nor directly controlled by an implementer or administrator, or whose conformance requirement is detailed elsewhere, is described by *can*. Behavior that never occurs in a conformant implementation or system of conformant implementations is described by *cannot*. The word *allow* is used as a replacement for the phrase "Support the ability for," and the word *capability* means "can be configured to."

143

144 **4.2 Profile Conformance Statement (PCS)**

The supplier of an implementation that is claimed to conform to this standard shall provide the information necessary to identify both the supplier and the implementation, and shall complete a copy of the PCS proforma provided in Annex A.

148 **4.3 Common requirements**

149 This subclause defines the common conformance requirements that are applicable for both 150 bridge and end station implementations claiming conformance to this standard. supporting ballot comment on 60802/D1.0 - 7 - Step 1 & 2

- 151 4.3.1 Common TSN-IA Profile requirements
- Bridge and end station implementations for which a claim of conformance to the TSN-IA Profile (Clause 6) is made, shall support
- a) The common PHY and MAC requirements (4.3.2);
- b) The common synchronization requirements (4.3.3);
- c) The common management requirements (4.3.4);
- 157 d) IEEE Std 802.1AB-2016;
- 158 e) IEEE Std 802.1AC-2016.
- 159

160 **4.3.2 Common PHY and MAC requirements**

- A bridge or end station implementation that conforms to the provisions of this standard shall support the following features as specified in IEEE Std 802.3-2018 or in its amendment:
- a) Implement at least one full duplex IEEE Std 802.3-2018 MAC with data rate of 10 Mbps or
 greater together with the corresponding managed objects on each port, including 10 Mb/s
 Single Twisted Pair Ethernet specified in IEEE Std 802.3cg-20XX as a possibility;
- b) Media Access Control (MAC) service specification (Clause 2 of IEEE Std 802.3-2018);
- 167 c) Media Access Control (MAC) frame and packet specifications (Clause 3 of IEEE Std 802.3 2018);
- d) Each of the maximum MAC Client Data field sizes according (3.2.7 of IEEE 802.3-2018);
- e) Media Access Control (Clause 4 of IEEE Std 802.3-2018);
- f) Layer Management (Clause 5 of IEEE Std 802.3-2018);
- g) Physical Signaling (PLS) service specifications (Clause 6 of IEEE Std 802.3-2018);
- h) Physical Signaling (PLS) and Attachment Unit Interface (AUI) specifications (Clause 7 of
 IEEE Std 802.3-2018);
- i) The capability not to assert Low Power Idle (LPI) on each port that supports Energy Efficient
 Ethernet (Clause 78 of IEEE Std 802.3-2018);
- j) Ethernet support for time synchronization protocols (Clause 90 of IEEE Std 802.3-2018);
- k) Interspersing Express Traffic (Clause 99 of IEEE Std 802.3-2018) for each MAC up to 1
 Gbps;
- 180 I) The capability to disable MAC control PAUSE if it is implemented.
- 181 182

4.3.3 Common requirements for synchronization

A bridge or end station implementation that conforms to the provisions of this standard shall support the following gPTP requirements (4.3.3.1) and meet the precision requirements (4.3.3.2).

187 4.3.3.1 gPTP requirements

- A bridge or end station implementation that conforms to the provisions of this standard shall support the following features with the corresponding managed objects and PICS as specified in IEEE Std 802.AS-2019:
- a) Time-aware system requirements (5.3 of IEEE Std 802.1AS-2019);
- b) PTP Instance requirements (5.4 of IEEE Std 802.1AS-2019);
- c) PTP Relay Instance requirements (5.4.2 of IEEE Std 802.1AS-2019);
- d) MAC-specific timing and synchronization methods for IEEE 802.3 full-duplex links (5.6 of IEEE Std 802.1AS-2019).

197 **4.3.3.2 Synchronization precision requirements**

- A bridge or end station implementation for which a claim of conformance to support synchronization is made (see item b) in 4.4) shall meet the following precision requirements:
- 200 The maximum link delay error shall be not greater than 10 ns;
- Note The maximum link delay error is externally measured from the MDI to MDI at the local link, including the asymmetry error contribution.
- a) The Minimal timestamp accuracy for any kind of timestamp shall be not greater than
- 1) 8 ns for a Working Clock;
- 205 2) 8 ns for universal time.
- 206

207 4.3.4 Common management requirements

- A bridge or end station implementation for which a claim of conformance to support SNMP MIBs is made shall support SNMP as specified in RFC 4789.
- A bridge or end station implementation for which a claim of conformance to support SNMP MIBs is made shall support NETCONF as specified in RFC 6241.
- 212

213 4.4 Common options

This subclause defines options that are common for both bridge and end station implementations claiming conformance to this standard. A bridge or end station implementation that conforms to the provisions of this standard may support:

- a) The common PHY and MAC options (4.4.1);
- b) The common synchronization options (4.4.2);
- c) The common management options (4.4.3);
- d) The common security options (4.4.4);
- e) IEEE Std 802.1CB-2017.
- 222

223 4.4.1 Common PHY and MAC options

A bridge or end station implementation that conforms to the provisions of this standard may support the following features as specified in IEEE Std 802.3-2018:

a) Interspersing Express Traffic (Clause 99 of IEEE Std 802.3-2018) for MAC greater than 1
 Gbps;

228

4.4.2 Common synchronization options

A bridge or end station implementation for which a claim of conformance to support synchronization is made shall support the IEEE Std 802.1AS-2019 features listed in 4.3.3 and may support the following IEEE Std 802.1AS-2019 features:

- a) Time-aware system options (5.4.1 of IEEE Std 802.1AS-2019);
- b) MAC-specific timing and synchronization methods for IEEE Std 802.11 (5.6 of IEEE Std 802.1AS-2019);
- 236

supporting ballot comment on 60802/D1.0 - 9 - Step 1 & 2

237 <<**Editor's Note**: The Time-aware system options of 5.4.1 should be examined carefully to 238 determine if any of those options should be mandatory for the purposes of this profile. A 239 contribution is welcome.>>

- A bridge or end station implementation for which a claim of conformance to support synchronization is made does not need to support the following IEEE Std 802.1AS-2019 features:
- c) MAC-specific timing and synchronization methods for IEEE 802.3 EPON (5.7 of IEEE Std 802.1AS-2019);
- d) MAC-specific timing and synchronization methods for coordinated shared network (CSN)
 (5.8 of IEEE Std 802.1AS-2019).
- 247

248 **4.4.3** Common management options

A bridge or end station implementation that conforms to the provisions of this standard may support:

- 251 a) SNMP MIBs;
- 252 b) YANG.
- 253
- 254

255 4.4.4 Common security options

- A bridge or end station implementation that conforms to the provisions of this standard may support the following standards for security:
- a) MAC Security as specified by IEEE Std 802.1AE-2018 (6.7);
- b) Port-Based Network Access Control as specified by IEEE Std 802.1X-2019 (6.7).
- 260
- 261

262 4.5 Bridge requirements

This subclause defines the conformance requirements that are applicable for bridge implementations claiming conformance to this standard.

265 4.5.1 Bridge TSN-IA Profile requirements

Bridge implementations for which a claim of conformance to the TSN-IA Profile (Clause 6) is made, shall support the common requirements (4.3), the bridging requirements (4.5.2), and the bridge requirements for synchronization (4.5.3).

269 4.5.2 Bridging requirements

- A bridge implementation that conforms to the provisions of this standard shall:
- a) Meet the VLAN Bridge requirements stated in items a) through r) in 5.4 of IEEE Std 802.1Q 2018;
- b) Support Multiple Spanning Tree (MST) operation as stated in item a) in 5.4.1 and in 5.4.1.1
 of IEEE Std 802.1Q-2018;
- c) Support frame preemption as stated in item ad) in 5.4.1.1 of IEEE Std 802.1Q-2018;
- d) Meet the Forwarding and Queuing Enhancements for time-sensitive streams (FQTSS)
 requirements as stated in 5.4.1.5 of IEEE Std 802.1Q-2018;
- e) Meet the C-VLAN component requirements stated in items a) through e) in 5.5 of IEEE Std
 802.1Q-2018;
- f) Meet the C-VLAN Bridge requirements stated in the introductory text in 5.9 of IEEE Std
 802.1Q-2018;

- 10 - supporting ballot comment on 60802/D1.0

- 282 g) Meet the MAC Bridge component requirements stated in items a) through j) in 5.13 of IEEE
 283 Std 802.1Q-2018;
- h) Meet the MAC Bridge requirements stated in the introductory text in 5.14 of IEEE Std
 802.1Q-2018;
- i) Meet the MAC-specific bridging methods requirements stated in the introductory text in 5.22
 of IEEE Std 802.1Q-2018;
- j) Support the strict priority algorithm for transmission selection (8.6.8.1 in IEEE Std 802.1Q-2018) on each port for each traffic class;
- 290 k) Support at least eight traffic classes on each port;
- 291 I) Support at least five VLANs;
- m) Support flow metering as specified in 8.6.5 in IEEE Std 802.1Q-2018;
- n) Support priority regeneration as specified 6.9.4 in IEEE Std 802.1Q-2018;
- o) Support the capability to disable Priority-based flow control if it is implemented (Clause 36 of IEEE Std 802.1Q-2018).
- 296
- 297 <<**Editor's note**: insert reference to appropriate section once "FDB and resource requirements" 298 discussion is concluded.>>
- 299

300 4.5.3 Bridge requirements for synchronization

A bridge implementation that conforms to the provisions of this standard shall support the common gPTP requirements (4.3.3.1) and meet the common precision requirements (4.3.3.2), and support the following precision requirement:

- a) The maximum residence time error contribution of a bridge shall be not greater than 10 ns.
- Note The maximum link delay error is externally measured from the MDI to MDI at the bridge.
- 306

307 4.6 Bridge options

- A bridge implementation that conforms to the provisions of this standard may:
- a) Meet the VLAN Bridge options stated in items b) through ac) in 5.4.1 of IEEE Std 802.1Q 2018;
- b) Support Multiple MAC Registration Protocol (MMRP) operation as stated in 5.4.1.3 of IEEE
 Std 802.1Q-2018;
- c) Meet the Per-stream filtering and policing (PSFP) requirements as stated in 5.4.1.8 of IEEE
 Std 802.1Q-2018;
- d) Meet the Cyclic queuing and forwarding (CQF) requirements as stated in 5.4.1.9 of IEEE
 Std 802.1Q-2018;
- e) Meet the Multiple VLAN Registration Protocol (MVRP) requirements as stated in 5.4.2 of IEEE Std 802.1Q-2018;
- f) Meet the Multiple Stream Registration Protocol (MSRP) requirements stated in 5.4.4 of IEEE
 Std 802.1Q-2018;
- g) Meet the C-VLAN component options stated in 5.5.1 of IEEE Std 802.1Q-2018;
- h) Meet the C-VLAN Bridge options stated in 5.9.1 of IEEE Std 802.1Q-2018;
- i) Meet the MAC Bridge component options stated in 5.13.1 of IEEE Std 802.1Q-2018;
- j) Meet the MAC Bridge options stated in 5.14.1 of IEEE Std 802.1Q-2018;
- k) Meet the bridge requirements specified by IEEE Std 802.1Qcc-2018;
- I) Meet the bridge requirements specified by IEEE Std 802.1Qcp-2018.

supporting ballot comment on 60802/D1.0 $\,$ – 11 – Step 1 & 2

A bridge implementation that conforms to the provisions of this standard does not need to:

- m) Support Port-and-Protocol-based VLAN classification stated in 5.4.1.2 of IEEE Std 802.1Q 2018;
- n) Support Connectivity Fault Management (CFM) stated in 5.4.1.4 of IEEE Std 802.1Q-2018;
- o) Meet the ETS Bridge requirements stated in 5.4.1.6 of IEEE Std 802.1Q-2018;
- p) Meet the DCBX Bridge requirements stated in 5.4.1.7 of IEEE Std 802.1Q-2018;
- q) Meet the VLAN Bridge requirements for congestion notification stated in 5.4.3 of IEEE Std
 802.1Q-2018;
- r) Support Shortest Path Bridging (SPB) operation stated in 5.4.5 of IEEE Std 802.1Q-2018;
- s) Support Path Control and Reservation (PCR) operation stated in 5.4.5 of IEEE Std 802.1Q 2018;
- t) Meet the S-VLAN component requirements stated in 5.6 of IEEE Std 802.1Q-2018;
- u) Meet the I-component requirements stated in 5.7 of IEEE Std 802.1Q-2018;
- v) Meet the B-component requirements stated in 5.8 of IEEE Std 802.1Q-2018;
- w) Meet the Provider Bridge requirements stated in 5.10 of IEEE Std 802.1Q-2018;
- x) Meet the System requirements for Priority-based Flow Control (PFC) requirements stated
 in 5.11 of IEEE Std 802.1Q-2018;
- y) Meet the Backbone Edge Bridge (BEB) requirements stated in 5.12 of IEEE Std 802.1Q 2018;
- z) Meet the TPMR component requirements stated in 5.15 of IEEE Std 802.1Q-2018;
- aa) Meet the TPMR requirements stated in 5.16 of IEEE Std 802.1Q-2018;
- bb) Meet the T-component requirements stated in 5.17 of IEEE Std 802.1Q-2018;
- cc) Meet the EVB Bridge requirements stated in 5.23 of IEEE Std 802.1Q-2018.
- 351

352 4.7 End station requirements

This subclause defines the conformance requirements that are applicable for end station implementations claiming conformance to this standard.

355 4.7.1 End station TSN-IA Profile requirements

End station implementations for which a claim of conformance to the TSN-IA Profile (Clause 6) is made, shall support the common requirements (4.3).

358 4.8 End station options

- An end station implementation that conforms to the provisions of this standard may:
- a) Meet the end station requirements and options for MMRP, MVRP, and MSRP stated in 5.18
 of IEEE Std 802.1Q-2018;
- b) Meet the end station requirements for FQTSS as stated in 5.20 of IEEE Std 802.1Q-2018;
- 363 c) Meet the end station requirements for enhancements for scheduled traffic as stated in 5.25
 364 of IEEE Std 802.1Q-2018;
- d) Meet the end station requirements for enhancements for frame preemption as stated in 5.26
 of IEEE Std 802.1Q-2018;
- e) Meet the end station requirements for PSFP as stated in 5.27 of IEEE Std 802.1Q-2018;
- f) Meet the end station requirements for cyclic queuing and forwarding as stated in 5.28 of
 IEEE Std 802.1Q-2018;
- g) Meet the end station requirements specified by IEEE Std 802.1Qcc-2018.

327

- An end station implementation that conforms to the provisions of this standard does not need to:
- h) Support Port-and-Protocol-based VLAN classification stated in 5.4.1.2 of IEEE Std 802.1Q 2018;
- i) Meet the End station requirements for congestion notification stated in 5.21 of IEEE Std
 802.1Q-2018;
- j) Meet the EVB station requirements stated in 5.24 of IEEE Std 802.1Q-2018.

379 380

381 **5 Industrial Automation**

This standard is concerned with the requirements of Industrial Automation and meeting these requirements with a bridged network. This clause gives an overview on Industrial Automation and describes Industrial Automation requirements.

385 **5.1 Overview**

This subclause provides an introductory overview for the description of Industrial Automation requirements to bridged networks provided in 6.2.

388 5.1.1 Control Loop Basic Model

Control loops are fundamental building blocks of industrial automation systems. Control loops include: process sensors, a controller function, and output signals. Control loops may require guaranteed low latency or more relaxed bounded latency network transfer quality.

- To achieve the needed quality for Control loops the roundtrip delay of the exchanged data is essential.
- shows the whole transmission path from Controller application to Device application(s) and
 back. The blue and red arrows show the contributions to the e2e (end-to-end) latency
 respectively.
- and show three levels of a control loop:
- Application within End Station,
- Network Access within End Station,
- Network / Bridges within Bridges.
- 401 Applications may or may not be synchronized to the Network Access depending on the 402 application requirements. Applications which are synchronized to Network Access are called 403 "isochronous applications". Applications which are not synchronized to Network Access are 404 called "non-isochronous applications".
- 405 Network Access shall be synchronized to a common working clock or to a local timescale.
- Network / Bridges may or may not be synchronized to a common working clock depending on
 whether the Enhancements for Scheduled Traffic (IEEE 802.1Q-2018) are applied.

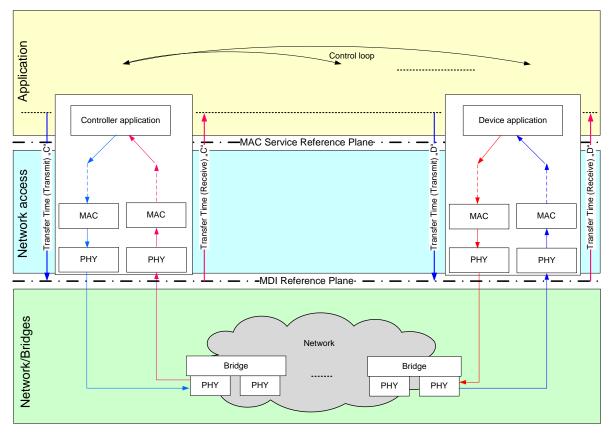

Figure 1 – Principle data flow of control loop

Transfer Times contain PHY and MAC delays. Both delays are asymmetric and vendor specific.
 Device vendors have to take into account these transfer times when their application cycle
 models are designed (see).

413

Table 2 – Application types

Level	Isochronous	Application	Non-isochronous Application		
Application	Synchronized to	network access	Synchronized to local timescale		
Network access	St	Synchronized to ream Class based sc	working clock, heduling, Preemptior	Synchronized to local timescale, Stream Class based scheduling, Preemption	
	Synchronized to working clock	Free running	Synchronized to working clock	Free running	Free running
Network/Bridges	Scheduled traffic + Strict Priority + Preemption	Strict Priority or other Shaper + Preemption	Scheduled traffic + Strict Priority + Preemption	Strict Priority or other Shaper + Preemption	Strict Priority or other Shaper + Preemption

414

415 **5.1.2 Industrial Traffic Types**

Industrial automation applications concurrently make use of different traffic schemes/patterns
 for different functionalities, e.g. parameterization, control, alarming. The various traffic patterns
 have different characteristics and thus impose different requirements on a TSN network.

Table 3 subsumes the industrial automation relevant traffic patterns to traffic types with their associated properties.

Traffic type name	Periodic/ Sporadic	Guarantee	Data size	Redundancy
Isochronous cyclic real-time	Ρ	Deadline/ bounded latency (e.g. 20%@1 Gbps / 50%@100 Mbit/s network cycle)/ bandwidth	Bounded	Up to seamless ¹⁾
Cyclic real-time	Ρ	Deadline/ bounded latency (e.g. n-times network cycle)/ bandwidth	Bounded	Up to seamless ¹⁾
Network control	S	Priority	_	Up to seamless ¹⁾ as required
Audio/video	Р	Bounded latency/ bandwidth	Bounded	Up to seamless ¹⁾ as required
Brownfield	Р	Bounded latency/ bandwidth	-	Up to regular ²⁾
Alarms/ events	S	Bounded latency/ bandwidth	-	Up to regular ²⁾
Configuration/ diagnostics	S	Bandwidth	-	Up to regular ²⁾
Internal / Pass- through	S	Bandwidth	-	Up to regular ²⁾
Best effort	S	-	-	Up to regular ²⁾
 ¹⁾ almost zero failo ²⁾ larger failover tir 		network re-convergence		

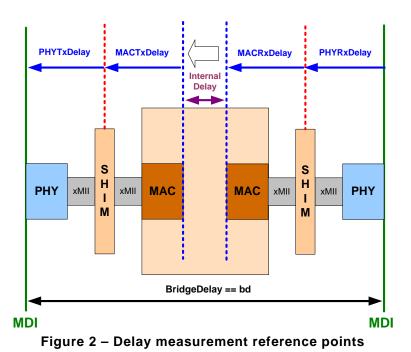

Table 3 – Industrial automation traffic types summary

423 **5.2 Requirements**

This subclause summarizes Industrial Automation requirements to bridged networks.

425 5.2.1 Bridge delay requirements

Figure 2 shows the definition the Bridge delay reference points. To make short control loop times feasible Bridge-delays shall be independent from the frame size and meet the upper limits of Table 8. supporting ballot comment on 60802/D1.0 $\,$ – 15 – Step 1 & 2

431 432

Table 4 – Required Ethernet Bridge delays

Data rate	Value	Comment	
10 Mbps	< 30 µs	Bridge delay measure from MII to MII ¹⁾	
100 Mbps	< 3 µs	Bridge delay measure from MII to MII ¹⁾	
1 Gbps	< 1 µs	Bridge delay measure from RGMII to RGMII ¹⁾	
2,5 Gbps	< 1 µs	Bridge delay measure from XGMII to XGMII ¹⁾	
5 Gbps	< 1 µs	Bridge delay measure from XGMII to XGMII ¹⁾	
10 Gbps	< 1 µs	Bridge delay measure from XGMII to XGMII ¹⁾	
25 Gbps – 1 Tbps:	< 1 µs	Bridge delay measure from XGMII to XGMII ¹⁾	
¹⁾ first bit in, first bit out			

433

434 **5.2.2** Network access

The following network access features for end stations according to IEEE 802.1 shall be supported:

- 437 a) Synchronization to working clock;
- 438 b) Stream class based scheduling with:
- 439 o Network cycle,
- 440 < 50 % bandwidth per link for < 1 Gbps for streams;
- 441 < 20 % bandwidth per link for >= 1 Gbps for streams;
- 442 < 25 % bandwidth per link for non-streams;
- 443 o Reduction ratio;
- o Phase;
- 445 o Sequence;

- 16 - supporting ballot comment on 60802/D1.0 Step 1 & 2 & 3

- 446 o Transmit of frames as a convoy starts at network cycle start with minimum interpacket
 447 gap (IPG); first isochronous cyclic real-time frames, second cyclic real-time frames, third
 448 non-stream frames;
- o Reception of frames before assigned network cycle based deadline;
- 450 c) Time limits for transfer time (receive), see , shall be $\leq 3 \mu s$ in addition to PHY-delay and 451 MAC-delay;
- d) Time limits for transfer time (transmit), see , shall be <= 3 μ s in addition to PHY-delay and MAC-delay;
- 454 e) Network access parameters:
- 455 o NetworkCycle according to Table 9,
- o ReductionRatio according to Formula (1),
- 457 o Phase according to Formula (2),
- 458 o Sequence according to Formula (3).

459 460

Table 5 – Values of the parameter NetworkCycle

NetworkCycle [time]	10 Mb/s [Data rate]	100 Mb/s [Data rate]	≥ 1 Gb/s [Data rate]
31,25 µs	n.a.	n.a.	Together with all ReductionRatios
62,5 µs	n.a.	n.a.	Together with all ReductionRatios
125 µs	n.a.	n.a.	Together with all ReductionRatios
250 µs	n.a.	Together with all ReductionRatios	Together with all ReductionRatios
500 µs	n.a.	Together with all ReductionRatios	Together with all ReductionRatios
1 ms	Together with ReductionRatio ≥ 8	Together with all ReductionRatios	Together with all ReductionRatios
2 ms	n.a.	Together with all ReductionRatios	n.a.
4 ms	n.a.	Together with all ReductionRatios	n.a.

461

The ReductionRatio shall be created according to Formula (1).

ReductionRatio = $2^n | n \in N_0 | n \le 10(1)$

Where

ReductionRatio	is the result of the operation
n	is actual factor for the operation
N ₀	are the natural numbers including zero

463

The Phase shall be created according to Formula (2).

supporting ballot comment on 60802/D1.0 -17 - Step 1 & 2

PhaseNumber = 1 to ReductionRatio (2)

Where

PhaseNumber	is the chosen one out the list
ReductionRatio	is the applied ReductionRatio

The Sequence shall be created according to Formula (3).

SequenceNum	nber = 1 to MaxListLength	(3)
SequenceNum	nber = 1 to MaxListLength	(3)

Where

SequenceNumber	is the chosen one out the list
MaxListLength	is the maximum possible entries per Phase

467	5.2.3	Bridge FDB requirements	
468	Editor's	note: Contribution reques	ted.
469	5.2.4	Bridge resource requireme	ents
470	Editor's	note: Contribution reques	ted.
471	5.2.5	Quantities	
472	The follo	owing quantities shall be sup	ported in a single TSN domain:
473	k) Stat	ions: >= 1 024	
474	l) Netv	vork diameter: >= 64	
475	m) Stre	ams per PLC for Controller-to	p-Device (C2D) communication:
476	- >	= 512 talker and >= 512 liste	ener streams;
477	- >	= 1 024 talker and >= 1 024	listener streams in case of seamless redundancy;
478	n) Stre	ams per PLC for Controller-to	o-Controller (C2C) communication:
479	- >	= 64 talker and >= 64 listene	er streams;
180	- >	= 128 talker and >= 128 liste	ener streams in case of seamless redundancy.
181	o) Stre	ams per Device for Device-to	-Device (D2D) communication:
182	- >	= 2 talker and >= 2 listener s	streams;
183	- >	= 4 talker and >= 4 listener s	streams in case of seamless redundancy.
484	Example	e calculation of data flow qua	ntities for eight PLCs – without seamless redundancy:
485	0 8	3 x 512 x 2	= 8 192 streams for C2D communication, plus
486	0	3 x 64 x 2	= 1 024 streams for C2C communication
487	0	8 192 + 1 024) * 2 000	= 18 432 000 Bytes data of all streams

488 5.2.6 Synchronization requirements

Synchronization covering both universal time and working clock timescales is needed forindustrial automation systems.

- Redundancy for synchronization of universal time may be solved with "cold standby". Support
 of "Hot standby" for universal time synchronization is not current practice but is an option in
 this document and can be used depending on the application requirements.
- Redundancy for Working Clock synchronization can be solved with "cold standby" or "hot standby" depending on the application requirements. Support of "hot standby" for working clock synchronization is required.
- 497 NOTE Global Time is often used as synonym term for "Universal Time". Wall Clock is based on Universal Time and
 498 considers time zones, daylight saving time and leap seconds.

499 5.2.6.1 Universal Time synchronization

500 Universal time is used to plant wide align events and actions (e.g. for "sequence of events"). 501 The assigned timescale is TAI, which can be converted into local date and time if necessary. 502 The goal of Universal Time synchronization is to establish a worldwide aligned timescale for 503 time. Thus, often satellites are used as source of the time.

504 5.2.6.2 Working Clock synchronization

505 Working Clock is used to align actions line, cell or machine wide. The assigned timescale is 506 ARB. Robots, motion control, numeric control and any kind of clocked / isochronous application 507 rely on this timescale to ensure that actions are precisely interwoven as needed. Often PLCs, 508 Motion Controller or Numeric Controller are used as Working Clock source.

- 509 Working Clock domains may be doubled to support zero failover time for synchronization by 510 aligning the both timescales at the Grandmaster.
- 511 TBD: two WC domains needs more definitions hot standby/cold standby need 512 definitions
- 513 High precision Working Clock synchronization is a prerequisite for control loop implementations.

514 5.2.6.3 General Requirements for Synchronization

- 515 Synchronization domain settings shall be according to and .
- 516

Table 6 – Synchronization Domains

ID	Timescales	Presence	Constraints
20	ARB	YES	Used for network access and application synchronization. If scheduled traffic is used then also used for Bridge synchronization.
0	TAI	YES	Used for Universal Time.
21	ARB	YES	Used for hot standby of Working Clock. Timescale shall be identical to Working Clock.
1	TAI	YES	Optional. Used for hot standby of Universal Time. Timescale shall be identical to Universal Time.
	20 0	20 ARB 0 TAI 21 ARB	20 ARB YES 0 TAI YES 21 ARB YES

517 TBD: ID is Domain number – all Timescales coded as PTP

In the working clock domain bridges shall take the roles of time aware relay and time aware endpoint, because they shall be in sync for scheduled traffic transmission.

In the Universal Time domain the role of a time aware relay is mandatory and the role of a time aware endpoint is optional for Bridges.

- 522 At least one grandmaster shall be present in every synchronization domain.
- 523 All members of a synchronization domain may take at least one of the roles specified in .

supporting ballot comment on 60802/D1.0 - 19 - Step 1 & 2

524

Table 7 – Synchronization Roles

Role	Working Clock		Universal Time	
	Bridge or Router	End Station	Bridge or Router	End Station
Time aware relay	mandatory	-	mandatory	_
Time aware endpoint	mandatory	mandatory	optional	mandatory
Grandmaster capable	Optional	optional	optional	optional

Editor Note: is support of UniversalTime/Time aware endpoint mandatory or optional for end stations? Contributions are welcome.

527 The requirements concerning the overall maximum deviation to the grandmaster time in the 528 synchronization domains in shall be fulfilled.

529

530

Table 8 – Maximum deviation to grandmaster time requirements

Domain	Maximum absolute value of deviation from grandmaster time	Comments
Working Clock	< 1 µs	Maximum deviation +/- 1 µs
Universal Time	< 100 µs	Maximum deviation +/- 100 µs
Editor's Note: reference number of hops (100) – "grandmaster time" must be defined –		

531 from TAI in case of universal time

shows the number of hops which shall be supported.

533 Table 9 – Maximum number of hops between grandmaster and time aware end-point

Domain	Number of hops	Comments
Working Clock	100	Grandmaster to time aware end-point. May be 200 between two time aware end-points.
Universal Time	100	From Grandmaster connected to the satellite receiver to each time aware endpoint.

534

535 The maximum working clock deviation between two devices, which are synchronized to the 536 same grandmaster, shall be < 2μ s when the working clock requirement of is observed.

537 <**Contributor's note**:

Not sure about good location. Table 15 and Table 16 are device requirements. Sections 4.3.3.2 and 4.5.3 of this contribution show an attempt how Table 15 and Table 16 may look like if converted to conformance requirement, i.e., if a device claiming conformance to this standard must meet the requirement. Note that, in this contribution, support for synchronization has been interpreted as an optional feature based on the rightmost column of Table 5 in D1.0.>>

The maximum error contribution of every single network node of the domains shall be according to .

545

Error contribution	Max. error	Comments
Maximum residence time error	< 10 ns	Externally measured from the MDI to MDI at the local Bridge.
Maximum link delay error	< 10 ns	Externally measured from the MDI to MDI at the local link – including the asymmetry error contribution.

546 Minimal timestamp accuracy for any kind of timestamp shall be according to .

Table 11 – Timestamp accuracy

Timestamp	Accuracy	Comments
Working Clock	\leq 8 ns	_
Universal time	\leq 8 ns	_

Table 5 specifies the clock synchronization profile contribution. The selection of the different clock types per device shall be provided using PICS.

550 Editor's Note: add requirement about asymmetry compensation

551

552

6 Industrial Automation profile

554 The objective of the Industrial Automation profile specified in this standard is to allow the 555 construction of bridged networks that meet the industrial automation requirements described in 556 Clause 5.

The bridges of an industrial automation bridged network shall meet the bridge requirements specified in Clause 4 and each link of an industrial automation bridged network is a full duplex point-to-point link. Furthermore, the industrial automation bridged network is designed, configured, and operated as described in this clause in order to meet the industrial automation requirements described in Clause 5. The end stations of an industrial automation deployment shall meet the end station requirements specified in Clause 4 in order to meet the industrial automation requirements described in Clause 5.

564

565 **6.1 Frame size**

The size of the Ethernet frames can influence whether or not the industrial automation requirements are met.

The maximum frame size is configured at each port of the industrial automation bridged network 568 according to the maximum frame size rules that apply to IEEE 802.3 frames. That is, the 569 maximum possible frame size from the destination MAC address through the end of the CRC is 570 2000 octets. For example, if nothing but the basic IEEE 802.3 headers are being used with an 571 IEEE 802.1Q C-VLAN tag, then the maximum frame size is 1522 octets. The maximum frame 572 size applied in a network can be smaller than the maximum frame size allowed by IEEE Std 573 802.3. Furthermore, the maximum frame size applied for different traffic classes can be 574 different. The maximum frame size actually applied for the different traffic classes is used in 575 worst-case latency calculations. 576

577	6.2	Traffic classes
578		
579	6.3	Latency
580		
581	6.4	Frame loss
582		
583	6.5	VLANs
584		
585	6.6	Synchronization
586		

supporting ballot comment on 60802/D1.0 -21 - Step 1 & 2

Redundancy for synchronization of universal time may be solved with "cold standby". Support
 of "Hot standby" for universal time synchronization is not current practice - but is an option in
 this document and can be used depending on the application requirements.

590 Redundancy for Working Clock synchronization can be solved with "cold standby" or "hot 591 standby" depending on the application requirements. Support of "hot standby" for working clock 592 synchronization is required.

593 Working Clock domains may be doubled to support zero failover time for synchronization by 594 aligning the both timescales at the Grandmaster.

595

All members of a synchronization domain may take at least one of the roles specified in .

597

Role	Working Clock		Universal Time		
	Bridge or Router End Station Bridge or Router		End Station		
Time aware relay	mandatory	-	mandatory	-	
Time aware endpoint	mandatory	mandatory	optional	mandatory	
Grandmaster capable	Optional	optional	optional	optional	

598 Editor Note: is support of UniversalTime/Time aware endpoint mandatory or optional for end 599 stations? Contributions are welcome.

600

601 6.7 Security

IEEE Std 802.1AE enables multiple, per traffic class, transmit secure channels for MAC and
 thus will also meet strict ordering requirements (within traffic class, with express or preemptible
 transmission being selected for all the priorities allocated to a traffic class) for preemption.

605 Secure Device Identifiers (DevIDs) are designed to be used as interoperable secure device 606 authentication credentials with Extensible Authentication Protocol (EAP) and other industry 607 standard authentication and provisioning protocols.

608

609 6.8 Further considerations

610 <**Contributor's note**:

Further considerations can be added here. A couple of examples provided in this contribution.

- 612 >>
- 613 6.8.1 Frame preemption
- 614

615 6.8.2 Flow control

The operation of flow control protocols, for example MAC control PAUSE (IEEE Std 802.3), or 616 Priority-based flow control (IEEE Std 802.1Q) operating on the priorities that are used to support 617 industrial automation traffic, can invalidate latency guarantees for industrial automation traffic. 618 Therefore, a bridge of an industrial automation bridged network shall be configurable to disable 619 MAC control PAUSE. MAC control PAUSE is disabled on any ports that support industrial 620 automation traffic. A bridge of an industrial automation bridged network shall be configurable 621 to disable Priority-based flow control. Priority-based flow control is disabled for the priorities 622 associated with industrial automation traffic on any ports that support industrial automation 623 traffic. 624

- 22 - supporting ballot comment on 60802/D1.0 Step 1 & 2 & 3

Given the bridge architectural model for points of attachment for higher layer entities, as 625 illustrated in Figure 8-18 of IEEE Std 802.1Q-2018, no higher layer entities within a bridge are 626 subject to these restrictions on the use of flow control protocols. However, where the 627 implementation makes use of the same MAC interface to support relayed frames and also higher 628 layer protocol operation, and where the implementation supports other MAC control protocols 629 that are not subject to relay by the bridge, all transmitted frames that are not relayed by the 630 bridge are subject to the same transmission selection algorithms as relayed frames, in order to 631 ensure that latency is not adversely affected. 632

633 6.8.3 Energy Efficient Ethernet

Energy Efficient Ethernet (EEE, specified in IEEE Std 802.3) specifies a Low Power Idle (LPI) 634 mode of operation for Ethernet LANs that allows the LAN to transition to a low power state when 635 there is no activity. Control of the LPI state is performed by the LPI client, which determines, 636 637 on the transmission side, when LPI is asserted and when it is de-asserted. When LPI is de-638 asserted, there is a delay (wake time) before the link is ready to operate; the longer the wake 639 time, the longer the additional latency due to the operation of EEE. Therefore, in an industrial automation bridged network, bridges do not assert LPI on a port that supports EEE and 640 industrial automation traffic. 641

PCS proforma – Time-sensitive networking profile for industrial automation

647 A.1 General

The supplier of an implementation that is claimed to conform to a particular profile defined in this standard shall complete the corresponding Profile Conformance Statement (PCS) proforma, which is presented in a tabular format based on the format used for Protocol Implementation Conformance Statement (PICS) proformas.

The tables do not contain an exhaustive list of all requirements that are stated in the referenced standards; for example, if a row in a table asks whether the implementation is conformant to Standard X, and the answer "Yes" is chosen, then it is assumed that it is possible, for that implementation, to fill out the PCS proforma defined in Standard X to show that the implementation is conformant; however, the tables in this standard will only further refine those elements of conformance to Standard X where particular answers are required for the profiles defined here.

The profiles are not intended to be mutually exclusive; it is possible that a given implementation can support more than one of the profiles defined in this standard. If that is the case, then either the PCS for the implementation should be filled out in order to reflect the support of multiple profiles, or a separate PCS should be filled out to reflect each profile supported.

A completed PCS proforma is the PCS for the implementation in question. The PCS is a statement of which capabilities and options of the protocol have been implemented. The PCS can have a number of uses, including use by the following:

- a) Protocol implementer, as a checklist to reduce the risk of failure to conform to the standard
 through oversight;
- b) Supplier and acquirer—or potential acquirer—of the implementation, as a detailed indication
 of the capabilities of the implementation, stated relative to the common basis for
 understanding provided by the standard PCS proforma;
- c) User—or potential user—of the implementation, as a basis for initially checking the
 possibility of interworking with another implementation (note that, while interworking can
 never be guaranteed, failure to interwork can often be predicted from incompatible PCSs);
- d) Protocol tester, as the basis for selecting appropriate tests against which to assess the claim for conformance of the implementation.

676 A.2 Abbreviations and special symbols

677 A.2.1 Status symbols

- 678 M: mandatory
- 679 O: optional
- 680 O.n: optional, but support of at least one of the group of options labeled by the same 681 numeral n is required
- 682 X: prohibited
- 683 pred: conditional-item symbol, including predicate identification: see A.3.4
- ⁶⁸⁴ ¬ logical negation, applied to a conditional item's predicate

685 A.2.2 General abbreviations

- 686 N/A: not applicable
- 687 PCS: Profile Conformance Statement

688 A.3 Instructions for completing the PCS proforma

689 A.3.1 General structure of the PCS proforma

The first part of the PCS proforma, implementation identification and protocol summary, is to be completed as indicated with the information necessary to identify fully both the supplier and the implementation.

The main part of the PCS proforma is a fixed-format questionnaire, divided into several 693 subclauses, each containing a number of individual items. Answers to the questionnaire items 694 are to be provided in the rightmost column, either by simply marking an answer to indicate a 695 restricted choice (usually Yes or No) or by entering a value or a set or range of values. (Note 696 that there are some items where two or more choices from a set of possible answers can apply; 697 all relevant choices are to be marked.) Each item is identified by an item reference in the first 698 699 column. The second column contains the question to be answered; the third column records the 700 status of the item—whether support is mandatory, optional, or conditional; see also A.3.4. The 701 fourth column contains the reference or references to the material that specifies the item in the main body of this standard, and the fifth column provides the space for the answers. 702

A supplier may also provide (or be required to provide) further information, categorized as either Additional Information or Exception Information. When present, each kind of further information is to be provided in a further subclause of items labeled Ai or Xi, respectively, for crossreferencing purposes, where i is any unambiguous identification for the item (e.g., simply a numeral). There are no other restrictions on its format and presentation.

A completed PCS proforma, including any Additional Information and Exception Information, is the Protocol Implementation Conformation Statement for the implementation in question.

NOTE Where an implementation is capable of being configured in more than one way, a single PCS may be able to describe all such configurations. However, the supplier has the choice of providing more than one PCS, each covering some subset of the implementation's configuration capabilities, in case that makes for easier and clearer presentation of the information.

714 A.3.2 Additional information

715 Items of Additional Information allow a supplier to provide further information intended to assist 716 the interpretation of the PCS. It is not intended or expected that a large quantity will be supplied, 717 and a PCS can be considered complete without any such information. Examples might be an 718 outline of the ways in which a (single) implementation can be set up to operate in a variety of 719 environments and configurations, or information about aspects of the implementation that are 720 outside the scope of this standard but that have a bearing on the answers to some items.

References to items of Additional Information may be entered next to any answer in the questionnaire and may be included in items of Exception Information.

723 A.3.3 Exception Information

It may occasionally happen that a supplier will wish to answer an item with mandatory status
(after any conditions have been applied) in a way that conflicts with the indicated requirement.
No preprinted answer will be found in the Support column for this item. Instead, the supplier
shall write the missing answer into the Support column, together with an Xi reference to an item
of Exception Information, and shall provide the appropriate rationale in the Exception item itself.

An implementation for which an Exception item is required in this way does not conform to this standard.

NOTE A possible reason for the situation described previously is that a defect in this standard has been reported,
 a correction for which is expected to change the requirement not met by the implementation.

733 A.3.4 Conditional status

734 A.3.4.1 Conditional items

The PCS proforma contains a number of conditional items. These are items for which both the applicability of the item itself, and its status if it does apply—mandatory or optional—are dependent on whether certain other items are supported. supporting ballot comment on 60802/D1.0 -25 - Step 1 & 2

Where a group of items is subject to the same condition for applicability, a separate preliminary question about the condition appears at the head of the group, with an instruction to skip to a later point in the questionnaire if the "Not Applicable" (N/A) answer is selected. Otherwise, individual conditional items are indicated by a conditional symbol in the Status column.

A conditional symbol is of the form "pred: S" where pred is a predicate as described in A.3.4.2, and S is a status symbol, M or O.

If the value of the predicate is true (see A.3.4.2), the conditional item is applicable, and its status is indicated by the status symbol following the predicate: The answer column is to be marked in the usual way. If the value of the predicate is false, the "Not Applicable" (N/A) answer is to be marked.

748 A.3.4.2 Predicates

A predicate is one of the following:

- a) An item-reference for an item in the PCS proforma: The value of the predicate is true if the
 item is marked as supported and is false otherwise.
- b) A predicate-name, for a predicate defined as a Boolean expression constructed by
 combining item-references using the Boolean operator OR: The value of the predicate is
 true if one or more of the items is marked as supported.
- c) The logical negation symbol " \neg " prefixed to an item-reference or predicate-name: The value of the predicate is true if the value of the predicate formed by omitting the " \neg " symbol is false, and vice versa.
- Each item whose reference is used in a predicate or predicate definition, or in a preliminary question for grouped conditional items, is indicated by an asterisk in the Item column.

760 A.3.4.3 References to other standards

- The following shorthand notation is used in the References columns of the profile tables:
- 762 <standard abbreviation>:<clause-number>
- where standard abbreviation is one of the following:
- 764 Q: IEEE Std 802.1Q
- 765 AS: P802.1AS-REV
- 766 Dot3: IEEE Std 802.3
- Hence, a reference to "IEEE Std 802.1Q-2018, 5.4.2" would be abbreviated to "Q:5.4.2"

768 A.4 Common requirements

769 A.4.1 Implementation identification

- The entire PCS pro forma is a form that shall be filled out by a supplier.
- 771

Supplier	
Contact point for queries about the PCS	
Implementation Name(s) and Version(s)	
Other information necessary for full identification, e.g., name(s) and version(s) of machines and/or operating system names	

Only the first three items are required for all implementations; other information may be completed as appropriate in meeting the requirement for full identification.

NOTE The terms "Name" and "Version" should be interpreted appropriately to correspond with a supplier's terminology (e.g., Type, Series, Model).

777 A.4.2 Profile summary, IEC/IEEE 60802

Identification of profile specification	IEC/IEEE 60802 - Time-Sensitive Networking Profile for Industrial Automation			
Identification of amendments and corrigenda to the PCS proforma that have been completed as part of the	Amd.	:	Corr.	:
PCS	Amd.	:	Corr.	:
Have any Exception items been required? (See A.3.3: the answer "Yes" means that the implementation does not conform to IEC/IEEE 60802)	No	[]	Yes	[]
Date of Statement				

778

779 A.4.3 Implementation type

This form is used to indicate the type of system that the PCS describes.

781

Item	Feature	Status	References	Support	
BGE	Is the implementation a Bridge?	0.1		Yes[]	No []
TLK	Is the implementation a Talker end station?	0.1		Yes[]	No []
LSN	Is the implementation a Listener end station?	0.1		Yes []	No []

NOTE a single device can incorporate the functionality of one or more of the functions listed in this table. For
 example, a device could have both Talker end station and Listener end station capability.

785

786 A.4.5 Common requirements— Bridges

⁷⁸⁷ If item BGE in A.4.3 is supported, then the Support column in ZZZZ through ZZZZ shall be ⁷⁸⁸ completed; otherwise the support column items in these tables shall be left blank.

The major capabilities to be supported in all Bridges are identified in ZZZZ. An Bridge shall support all mandatory requirements that apply to a VLAN-aware Bridge component, and to support IEEE Std 802.1AS.

Additional requirements for IEEE 802.1Q implementation that apply to all Bridges are identified
 in ZZZZ. These cover detailed requirements for tagging, VID, FID, MSRP, and forwarding
 support.

Additional requirements for IEEE 802.1AS implementation that apply to all AV Bridges are identified in ZZZZ.

797 A.4.6 Major capabilities—Bridges
