That's the PAR extention!

IETF RFC 9195

60802 selects for the station available features and YANG modules

60802 specifies YANG module(s) adding missing information about states (e.g. sync state of ClockSource and ClockTarget), quantities and available features. The information is assumed to be read only.

All of the above YANG defined information is available in the Digital Data Sheet created out of the station based on RFC 9195.
