Editor's Report 60802 Draft 2.0

January 2023

Jordon Woods, Analog Devices

Expected contributions

Description	Contriubtor(s)	Status	Remarks
A contribution clarifying the depiction of the transmit and receive			
paths and the positioning of middleware in figures 2 &3	Guenter/Marius/Mark	Received	Incorporated in d2.0
A contribution describing the queueing of frames on ingress (figure			
3). An alternative to the term "queueing frames" will be considered			
as the term may be confused with 802.1Q, 8.6.6.	Guenter/Marius/Mark	Received	Incorporated in d2.0. Term queueing frames eliminated in figure 3
A contribution breaking the 8 capablities defined in RFC 6241 into			
atomic requirements and options	Martin	Received	Incorporated in d2.0
Contribution specifying the exact gPTP parameters and associated			
values in tables 9 and 10	Time Sync adhoc	Received	Parameters for control loop and global clock are missing
Contribution specifying total noise budget, including Dynamic			
timestamp error	Time Sync adhoc	Received	Parameters for control loop and global clock are missing
A contribution outlining the specific requirements for Grandmaster			
PTP Instances	Time Sync adhoc	Received	Parameters for control loop and global clock are missing
Update figure 13 to include clock state information.	Guenter	Received	Incorporated in d2.0
A contribution clarifying figures 17 and 18 and improving the			
readability of both figures	Guenter	Received	Incorporated in d2.0
Textual contribution covering the resolution of D1.4 comments	Oliver/Andreas/Kai	Received	Incorporated in d2.0
against security (not covered by other contributions identified			
herein)			
lextual contribution on the Secure Device Identity Profile	Oliver/Andreas/Kai	Waiting for feedback from the	Encompasses:
Textual contribution on the Secure Device Identity Profile	Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR
Textual contribution on the Secure Device Identity Profile	Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths
rextual contribution on the Secure Device Identity Profile	Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup)	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization	Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses:
Textual contribution on the Secure Device Identity Profile	Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and
Textual contribution on the Secure Device Identity Profile	Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles Encompasses
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization	Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023)	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf v500 cert de acteor ietf-acteor formula
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm)
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security Textual contribution regarding Internal key generation (see	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm)
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security Textual contribution regarding Internal key generation (see comment 468)	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm)
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security Textual contribution regarding Internal key generation (see comment 468) IA-station Figures Update Contribution regarding VI ANI paming scheme	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Stephan/Guenter/Mark	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open Open Received Received	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm) Incorporated in d2.0
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security Textual contribution regarding Internal key generation (see comment 468) IA-station Figures Update Contribution regarding VLAN naming scheme	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Stephan/Guenter/Mark Josef	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open Open Received Received	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm) Incorporated in d2.0 Incorporated in d2.0
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security Textual contribution regarding Internal key generation (see comment 468) IA-station Figures Update Contribution regarding VLAN naming scheme Contribution regarding the form of the digital data sheet Source Diagrams for figures 26 and 27	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Stephan/Guenter/Mark Josef	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open Open Received Received Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm) Incorporated in d2.0 Incorporated in d2.0
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security Textual contribution regarding Internal key generation (see comment 468) IA-station Figures Update Contribution regarding VLAN naming scheme Contribution regarding the form of the digital data sheet Source Diagrams for figures 26 and 27 Contribution regarding V	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Stephan/Guenter/Mark Josef Stephan/Guenter/Mark	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open Open Received Received Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm) Incorporated in d2.0 Incorporated in d2.0
Textual contribution on the Secure Device Identity Profile Textual contribution on Resource Access Authorization A contribution regarding the specific YANG features and leaves required for security Textual contribution regarding Internal key generation (see comment 468) IA-station Figures Update Contribution regarding VLAN naming scheme Contribution regarding the form of the digital data sheet Source Diagrams for figures 26 and 27 Contribution revising Annex Z	Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Oliver/Andreas/Kai Stephan/Guenter/Mark Josef Stephan/Guenter/Mark Nemanja Mark	Waiting for feedback from the discussion with NIST (conducted by the IEEE 802.1 Security Taskgroup) Open (expect initial proposal for discussion [form factor: pptx] during Q1/2023) Open Open Received Received Received Open Received Open	Encompasses: - Detailing the use of IEEE 802.1AR esp. clarifying the supported elements of IEEE Std 802.1AR - Addressing the use of RSA-2048/SHA-256 and in addition, the use of RSA with other key lengths - Multiple IDevID credentials per IA station to support multiple cryptographic algorithms Encompasses: - Expanding access control to all YANG modules esp. elaborating their authorization model and associated roles - Expanding the role names and including vendor-specific and owner-operator roles Considers the security-specific YANG modules (ietf-truststore, ietf-keystore, ietf-crypto-types, ietf-x509-cert-to-name, ietf-netconf-acm) Incorporated in d2.0 Not yet incorporated in d2.0

- All but 1 of the received contributions incorporated
- All comments reviewed
 - 434 Implemented
 - 27 comments are dependent on outstanding contributions
 - 1 comment (63) requires further discussion
