P802.1Qdy - RSTP/MSTP YANG – Reusability across SDOs
Murugan Balraj (Nokia)
(murugan.balraj@nokia.com)
Introduction

This presentation

• Highlights a problem in the proposed YANG model for RSTP, MSTP as part of P802.1Qdy that would prevent its reuse in other SDOs like BBF.

• Presents a possible solution that would allow the YANG model to be reused by other SDOs, but at the same time preserve the overall structure and functionality of the YANG from IEEE 802.1 perspective.

• Highlights some inconsistencies in the data that could arise and possible solution.
The problem (RSTP)

48.6 YANG modules

Insert 48.6.26 after 48.6.25 (inserted by IEEE Std 802.1Qdx-2024) as follows:

48.6.26 The iee802-dot1q-rstp YANG module

module iee802-dot1q-rstp {
  yang-version 1.1;
  namespace "urn:ieee:std:802.1Q.yang:ieee802-dot1q-rstp";
  prefix rstp;

  %augments-dot1q-bridge-
  augment "/dot1q:bridges/dot1q:bridge/dot1q:component"
  description "Augment Bridge with RSTP configuration."
  reference "13.24, 13.25, and 13.26 of IEEE Std 802.1Q."
  container rstp {
    presence "The presence of this container indicates that RSTP is supported";
  }

  %augments-dot1q-port-
  augment "/if:interfaces/if:interface/dot1q:bridge-port"
  description "Augment Bridge Port with RSTP configuration"
  reference "13.24, 13.25, and 13.27 of IEEE Std 802.1Q."
  container rstp {
    presence "The presence of this container indicates that RSTP is supported";
  }

The “augments” clause present in the YANG module cannot be overridden and this makes it impossible for other SDOs to use this YANG module since they may not have the notion of Bridge / Component.
The problem (MSTP)

The “augments” clause present in the YANG module cannot be overridden and this makes it impossible for other SDOs to use this YANG module since they may not have the notion of Bridge / Component.
BBF device YANG view (hardware/component/interface/L2-forwarding)

BBF specific YANG modules augments and/or leafref the IETF hardware/component, IETF system and IETF interfaces YANG modules. /hw:hardware/hw:component /sys:system /if:interfaces-state/if:interface
Reference: Common YANG Modules for Access Networks (broadband-forum.org), Page 13, section 1.2, Figure 1 – YANG Data Model Relationships
IEEE 802.1 YANG hierarchy: "/dot1q:bridges/dot1q:bridge/dot1q:component", "/if:interfaces-state/if:interface/dot1q:bridge-port"

BBF YANG modules {bbf-l2-forwarding-forwarders, bbf-l2-forwarding-forwarding-databases, bbf-sub-interface-tagging etc} builds the forwarding view of a BBF Device.
Reference: Common YANG Modules for Access Networks (broadband-forum.org), Page 43,44, Section 7 “BBF Layer 2 Forwarding Data Model”. IEEE 802.1 YANG hierarchy 
"/dot1q:bridges/dot1q:bridge/dot1q:component/dot1q:bridge-vlan/dot1q:vid-to-fid", 
"/dot1q:bridges/dot1q:bridge/dot1q:component/dot1q:filtering-database/dot1q:filtering-entry" etc.

BBF specific interface-type on top of IETF interface-type to configure VLAN tag match criteria, other configurations and state data
Example forwarding YANG view of BBF device

Forwarder YANG model defined with the support for:
- forwarding database related configuration and state data.
- Configuring list of forwarder port (leafref to a vlan-sub-interface) that are part of this forwarder. VLAN information/processing rules are configurable as part of the vlan-sub-interface YANG Model.
Proven strategy for reusability across SDOs
The YANG module that other SDOs like BBF would use in their devices has to be free of “augment” clauses and references to Bridge / Component / Bridge Port.

• Split the YANG module into two modules. The Base YANG module would contain the protocol specific YANG definitions and an IEEE 802.1 specific module would augment this base module and contain the “augment” clauses.

• Other SDOs like BBF could then use just the Base YANG module.

Following are some examples of existing IEEE 802.1 YANG models that are reusable

(Path: https://github.com/YangModels/yang/blob/main/standard/ieee/published/802.1)

Example of some existing IEEE 802.1 YANG models

### IEEE 802.1 Base CFM model

*(Protocol specific YANG definitions)*

- `ieee802-dot1q-cfm.yang`

### IEEE 802.1 Bridge specific CFM augmentation

- augment “/dot1q-cfm:cfm/dot1q-cfm:maintenance-group”
  ---bridge-name -> leafref to IEEE 802.1 Bridge
  ---bridge-component-name -> leafref to IEEE 802.1 Bridge component

- augment “/dot1q-cfm:cfm/dot1q-cfm:maintenance-group/dot1q-cfm:mep”
  ---interface-ref -> leafref to IETF interface

- `ieee802-dot1q-cfm-bridge.yang`

### BBF specific CFM augmentation

- augment “/dot1q-cfm:cfm/dot1q-cfm:maintenance-group”
  ---forwarder -> leafref to BBF Forwarder

- augment “/dot1q-cfm:cfm/dot1q-cfm:maintenance-group/dot1q-cfm:mep”
  ---interface-ref -> leafref to BBF vlan-sub-interface

- `bfb-dot1q-cfm-interfaces.yang`
  `bfb-dot1q-cfm-l2-forwarding.yang`

### Note:
Recommendation ITU-T Y.1731 CFM also uses the IEEE 802.1 Base CFM model to augment ITU-T Y.1731 specific CFM YANG definitions.
Example of some existing IEEE 802.1 YANG Models

The IEEE 802.1 Bridge specific YANG module has a “uses” statement that augments the “Component” with the “grouping” from the base module.

IEEE 802.1 Bridge specific augmentation

```
ieee802-dot1q-psfp-bridge.yang
augment "/dot1q:bridges/dot1q:bridge/dot1q:component {
  uses psfp:psfp-parameters
}
```

Other SDO specific augmentation

Other SDOs like BBF could also utilize the “uses” statement to include the “grouping”.

Other YANG models “Scheduler, Stream Filters and Gates, Preemption and Congestion-isolation” also follow the same approach. The Base module has a “grouping” statement and the SDO specific module achieves the augmentation with the “uses” statement.
P802.1Qdy decoupling proposal – overall strategy

Implementation in a device conforming to IEEE 802.1 specifications

Device conforming to IEEE 802.1 specifications would implement the YANG model of: 

1. Protocol specific aspects YANG definition (reusable across SDOs)
2. IEEE 802.1 device specific YANG augmentation
P802.1Qdy decoupling proposal – overall strategy

Implementation in other SDOs

Device conforming to BBF specifications would implement the YANG model of: 1 & 3
IEEE 802.1Qdy decoupling proposal – more details

IEEE 802.1Qdy current YANG definition

IEEE 802.1 device specific YANG module which uses Base YANG module

Can be reused in other SDOs like BBF

Base YANG module – MSTP protocol specific YANG definitions as YANG grouping

Per component MSTP augment

YANG module "ieee802-dot1q-mstp-bridge.yang" :

- augment "/dot1q:bridges/dot1q:bridge/dot1q:component/dot1q:bridge-mst"
  - uses mstp-per-component-protocol-specific-data

Per interface MSTP augment

YANG module "ieee802-dot1q-mstp-bridge.yang" :

- augment “/if:interfaces/if:interface/dot1q:bridge-port”
  - uses mstp-per-interface-protocol-specific-data

YANG module "ieee802-dot1q-mstp.yang" :

- YANG “Grouping” (mstp-per-component-protocol-specific-data)
  - MSTP YANG configuration/state data which are per component specific.

YANG module "ieee802-dot1q-mstp-bridge.yang" :

- YANG “Grouping” (mstp-per-interface-protocol-specific-data)
  - MSTP YANG configuration/state data which are per interface specific.
P802.1Qdy decoupling proposal – MSTP YANG

**Note:** Only the YANG is restructured considering reusability. The resultant YANG tree/functionality is the same as that on page 20 of 802-1Qdy-d2-0.pdf
module: ieee802-dot1q-mstp-bridge

augment /dot1q:bridges/dot1q:bridge/dot1q:component/dot1q:bridge-mst:
  +--rw mst-config-id!
    |   +--rw format-selector?   int32
    |   +--rw configuration-name? string
    |   +--rw revision-level?    uint32
    |   +--ro configuration-digest? binary
  +--rw bridge-mstp!
    +--rw max-hops?            int32
    +--ro ist-internal-root-path-cost? uint32
  +--rw mst* [mstid]
    +--rw mstid               uint16
    +--rw port-id-priority?    dot1q-types:priority-type
    +--ro internal-root-path-cost? uint32
    +--ro root-port-number?    dot1q-types:port-number-type

The config / state parameters augmented using ieee802-dot1q-mstp.yang grouping.
P802.1Qdy decoupling proposal – MSTP YANG

Resultant YANG tree (IEEE 802.1 Bridge Port)

module: iee802-dot1q-mstp-bridge

augment /if:interfaces/if:interface/dot1q:bridge-port:
  +--rw port-mstp!
    +--rw mst* [mstid]
    | +--rw mstid
    | +--ro msti-port-state? enumeration
    | +--ro msti-port-role? enumeration

RSTP/MSTP per interface configuration/state data view

Forwarding view:
List of forwarders per MSTI, Which are implicitly map list of VIDs to MSTI.

E.g. ifType ethernetCsMaCd, ieee8023adLag...

bbf-l2-forwarding-forwarders.yang
bbf-l2-forwarding-forwarding-databases.yang
Some observations on configuration/data consistency

• By using the YANG definitions for MSTP specified/proposed across IEEE P802.1Q-2022-REV and P802.1Qdy, there exists possibilities of the resultant configuration being inconsistent.

• Value(s) for one (set of) YANG object(s) could differ from another (set of) YANG object(s) that are otherwise supposed to have the same value(s).

• Even if the values are same/aligned between the different YANG objects, it would still mean that there are redundant objects in the YANG tree, i.e. two or more XPATHS pointing to essentially the same configuration.

• Details are explained in subsequent slides.
Some observations on configuration/data consistency

Possible inconsistencies

In IEEE P802.1Q-2022-REV, a container “bridge-mst” is defined with an object “mstid” which is a leaflist (/bridges/bridge/component/bridge-mst/mstid)

In IEEE P802.1Q-2022-REV, a container “bridge-mst” is defined which has a list “fid-to-mstid” that also has an object mstid /bridges/bridge/component/bridge-mst/fid-to-mstid/mstid

In IEEE P802.1Q-2022-REV, a container “bridge-mst” is defined which has a list “fid-to-mstid-allocation” that also has an object mstid /bridges/bridge/component/bridge-mst/fid-to-mstid-allocation/mstid

In P802.1Qdy, another list for the mst instance is introduced (/bridges/bridge/component/bridge-mst/bridge-mstp/mst)

Since all the above objects refer to the same MST Instance ID, there could be a different set of values in each of these lists.

Highlighted in **RED** are misconfigurations w.r.t /bridges/bridge/component/bridge-mst/mstid leaf-list configuration
Some observations on configuration/data consistency

Possible solution

Avoiding inconsistent configuration and/or redundant data may require modifying the YANG objects specified in IEEE Std 802.1Q-2022 under “/bridges/bridge/component/bridge-mst”.

- Would it be acceptable to remove the “mstid” leaf-list from IEEE Std 802.1Q?
- The list /bridges/bridge/component/bridge-mst/bridge-mstp/mst proposed as part of P802.1Qdy should be sufficient to configure the MST instances. This list would be the main list/configuration for the set of MST instances in each Bridge component.
- If there is a need to refer/specify the “mstid” anywhere else in the YANG tree, a “leafref” type could be used.
- E.g. In the two lists “fid-to-mstd” and “fid-to-mstd-allocation”, the definition of “leaf mstd” could be changed from “type dot1qtypes:mstid-type” to “type leafref”.
- Also, these two lists would need to be moved to the newly proposed IEEE 802.1 specific YANG module “ieee802-dot1q-mstp-bridge” (since these would need to be augmented to Bridge-component).
Some observations on configuration/data consistency

Possible solution

Module ieee802-dot1q-bridge

leaf-list mstid {
  type dot1qtypes:mstid-type;
  description
    "The list of MSTID values that are currently supported by the Bridge";
}

Remove the “mstid” leaf-list from IEEE Std 802.1Q
Some observations on configuration/data consistency

Possible solution

```plaintext
Module ieee802-dot1q-bridge

list fid-to-mstid {
  key "fid";
  description "The FID to MSTID allocation table.";
  reference "12.12.2 of IEEE Std 802.1Q";
  leaf fid {
    type uint32;
    description "The Filtering Database identifier.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
  leaf mstid {
    type dot1qtypes:mstid-type;
    description "The MSTID to which the FID is to be allocated.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
}
```

Change the type of “mstid” in list “fid-to-mstid”

```plaintext
Module ieee802-dot1q-bridge

list fid-to-mstid {
  key "fid";
  description "The FID to MSTID allocation table.";
  reference "12.12.2 of IEEE Std 802.1Q";
  leaf fid {
    type uint32;
    description "The Filtering Database identifier.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
  leaf mstid {
    type leafref {
      path '../../dot1q-mstp:bridge-mstp/dot1q-mstp:mst/dot1q-mstp:mstid';
    }
    description "The MSTID to which the FID is to be allocated.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
}
```
Some observations on Configuration/Data consistency

Possible Solution

Module ieee802-dot1q-bridge

list fid-to-mstid-allocation {
  key "fids";
  description "The FID to MSTID allocation table";
  leaf fids {
    type dot1qtypes:vid-range-type;
    description "Range of FIDs.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
  leaf mstid {
    type dot1qtypes:mstid-type;
    description "The MSTID to which the FID is allocated.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
}

Change the type of “mstid” in list “fid-to-mstid-allocation”

Module ieee802-dot1q-bridge

list fid-to-mstid-allocation {
  key "fids";
  description "The FID to MSTID allocation table";
  leaf fids {
    type dot1qtypes:vid-range-type;
    description "Range of FIDs.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
  leaf mstid {
    type leafref { path './mstp:bridge-mstp/dot1q-mstp:mst/mstp:mstid'; }
    description "The MSTID to which the FID is allocated.";
    reference "12.12.2 of IEEE Std 802.1Q";
  }
}
Example of an existing IEEE 802.1 CFM YANG approach preventing configuration/data inconsistency

Module ieee802-dot1q-cfm
container cfm {
    ...
    list maintenance-domain {
        key "md-id";
        ...
        list maintenance-association {
            key "ma-id";
            ...
            list maintenance-association-mep {
                key mep-id;
                ...
            }
        }
    }
    list maintenance-group {
        key "maintenance-group-id";
        ...
        leaf md-id {
            type leafref { path '/cfm/maintenance-domain/md-id';
            }
        }
        leaf ma-id {
            type leafref {
                path '/cfm' + '/maintenance-domain[md-id = current()]/../md-id/maintenance-association/ma-id';
            }
        }
        list mep {
            key "mep-id";
            leaf mep-id {
                type leafref {
                    path '/cfm/maintenance-domain[md-id = current()]/../md-id' + '/maintenance-association[ma-id = current()]/../ma-id/maintenance-association-mep/mep-id';
                }
            }
        }
    }
    ...
}

Ref: ieee802-dot1q-cfm.yang

The CFM list (/cfm/maintenance-group/mep/mep-id) for the local MEP configuration refers the main list (/cfm/maintenance-domain/maintenance-association/maintenance-association-mep/mep-id) using leafref YANG type.

By using YANG leafref type approach, configuration/data inconsistency problem avoided between the main list and the local MEP configuration list.

Similarly,
- the “md-id” leaf configuration in the “maintenance-group” also defined with leafref YANG type to the main list “/cfm/maintenance-domain/md-id”.
- the “ma-id” leaf configuration in the “maintenance-group” also defined with leafref YANG type to the main list “/cfm/maintenance-domain/maintenance-association/ma-id”.

leafref
Some observations on configuration/data consistency

Possible solution

• If the lists “fid-to-mstid” and “fid-to-mstid-allocation” are updated, then these need to be placed in the IEEE 802.1 specific YANG module that has been proposed “ieee802-dot1q-mstp-bridge”, since these are linked to Bridge-component that may not be used by other SDOs.

• We could also decide to not disturb the existing objects “leaf-list mstid”, list “fid-to-mstid” and list “fid-to-mstid-allocation” and leave it to equipment vendors or even service providers / operators to ensure that an actual device configuration does not have inconsistencies.

• But it may be preferable to have the consistency checks inherent in the YANG model.
P802.1Qdy – RSTP/MSTP resultant YANG files

These RSTP protocol specific configuration and state data directly augment "/bridges/bridge/component". A non-IEEE 802.1 device cannot import this YANG module due to the direct augmentation.

These RSTP protocol specific interface configuration and state data directly augment "/interface/interface/bridge-port". A non-IEEE 802.1 device cannot import this YANG module due to the direct augmentation.
These MSTP protocol specific configuration and state data directly augment "/bridges/bridge/component". A non-IEEE 802.1 device cannot import this YANG module due to the direct augmentation.

These MSTP protocol specific interface configuration and state data directly augment "/interface/interface/bridge-port". A non-IEEE 802.1 device cannot import this YANG module due to the direct augmentation.
P802.1Qdy decoupling proposal – more details

**ieee802-dot1q-mstp.yang**

YANG “Grouping” - Group MSTP Protocol specific configurations and state data.

A grouping for MSTP protocol configuration and state data parameters which are component specific.

A grouping for MSTP protocol configuration and state data parameters which are interface specific.

**ieee802-dot1q-rstp.yang**

YANG “Grouping” - Group RSTP Protocol specific configurations and state data.

A grouping for RSTP protocol configuration and state data parameters which are component specific.

A grouping for RSTP protocol configuration and state data parameters which are interface specific.

**ieee802-dot1q-rstp-bridge.yang**

Augments IEEE 802.1 Bridge Component/Bridge-port with RSTP YANG definitions from ieee802-dot1q-rstp.yang.

**ieee802-dot1q-mstp-bridge.yang**

Augments IEEE 802.1 Bridge Component/Bridge-port with MSTP YANG definitions from ieee802-dot1q-mstp.yang.
