	ı			1			
3	11.1.1.1	TLP	е		"Ensure"ing anything is beyond the scope of a standard. This text should be written to reflect realistic expectations.	Change the second and third sentences to read "The AP shall initialize its TSF timer independently of any simultaneously-started APs in an effort to minimize the synchronization of the TSF timers of multiple APs The AP shall periodically transmit special frames called Beacons that contain a copy of its TSF timer to synchronize the other stations in a BSS." and the last sentence to read "If a station's TSF timer is different from the timestamp in the received Beacon, the receiving station shall set its local timer to the received timestamp value."	Accepted
4	11.1.1.2	TLP	e		Clean up the referents.	Change the second sentence to read "Each station in the BSS shall transmit Beacons according to the algorithm described in this clause. Each station in an IBSS shall adopt the timing received from any Beacon or Probe Response which has a TSF value greater than its own TSF timer."	Accepted
5	11.1.1.2 2nd ¶	TLP	Т	Yes	The last two sentences of 11.1.1.2 contradict each other. The first states that a STA hearing another IBSS will join that IBSS and adopt its parameters. The second states that a STA joining an IBSS shall set its parameters to prespecified initial values. Both constraints apply to a STA hearing another IBSS, but require inconsistent actions.	Rewrite to specify precisely whatever is the intended behavior.	ACCEPTED: The second paragraph here only applies to coalescing and has been moved to 11.1.4 and has been merged with the description there. (Check with TLP).
6	11.1.2	TLP	t		What minimum data rate within the PHY is required to meet this 4 μs promise? No PHY is implied by the MAC; a 1 Hz ELF PHY is not precluded.	Specify the minimum PHY data rate for which this promise holds.	ACCEPTED: Added sentence to indicate that it is for PHYs of 1Mbit/sec or higher.
7	11.1.2.2	RM	Т	Y	From the description of the IBSS beacon generation mechanism it appears that multiple stations are likely to generate collidin beacons anytime that the medium is busy at TBTT. The		ACCEPTED: with modified text. (check with RM).

					algorithm described in this section does not honor the usual practice of halting th⊕ackoff counter when the medium is sensed busy. In the worst case, the duration of an frame in progress may surpass TBTT €wmin, causing all stations to send beacons.	twice aCWmin, b) wait for the period of the random delay If, if a reception is in progress during the random delay period, begin the delay at at the end of the random delay, extend the delay until the end of that reception. c) if no Beacon has arrived during the delay period, send a Beacon. See Figure 55,.		
8	11.1.2.2	WD	e			Change BSS into IBSS	Accepted	
9	11.1.2.3	KC	t	Y	" if the value of the adjusted timestamp is greater than the value of the station's TSF timer." What kind of "greater than" is to be used here? These are counters that roll over. Is this just unsigned greater than over the number of bits in the field, or is it signed greater than for something that is assumed to never be more than 1/2 way around the clock, or what?	Specify exact comparison algorithm.	ACCEPTED: changed greater to later. (OK with KC)	
10	11.1.2.3	TLP	e		It is the values, not the timestamps, that are adjusted.	Relocate the word "adjusted" to qualify "value" at both occurrences.	Accepted	
11	11.1.2.3	TLP	Т		$\pm0.0025\%$ is four times the frequency accuracy of most crystals, which are typically $\pm0.01\%$ devices. Anything better than $\pm0.005\%$ typically requires temperature compensation and consequent power and expense. Is this $\pm0.0025\%$ really necessary?	Resolve the question. A note detailing the rationale for the extra expense of temperature-compensated crystals might be in order.	REJECTED: This accuracy requirement is derived from the PHY specification. (check with TLP)	
12	11.1.3 10.3.2,	SB	t	N	Clause 11.1.3 states that: A station performs scanning when it has aScanState equal True. aDesiredSSID indicates the SSID which is to be scanned for, together with whether Infrastructure BSSs, Independent BSSs, or both, are to be included in the scan. Now 10.3.2.1 defines the MLMESCAN.request primitive which initiates a scan (this cannot be done by a MLMESET.request on aScanState since this is GET	Probably the easiest thing to do is to add the text to the 'effect of receipt'. This request shall update aDesiredSSID and aScanMode, and set aScanState true initiate the scan process-when the current transmission/reception is completed. Some clarification changes might also be made to 11.1.3 to make the role of	ACCEPTED: Modified text to indicate that scanning is started as the result of the reception of an MLMESCAN.request primitive. (check with SB)

36	11.2.1.9	KC	Т	Y	" shall be based on the aListenInterval"	Specify exact algorithm.	ACCEPTED:
					The default value of aListenInterval is 0 and this section says that the AP can age out messages older than this by some unspecified algorithm. What if an STA does not receive a beacon correctly, and thus does not respond on the first chance? Does that mean a 0 value allows the AP to dump the message?		Added text to indicate that the aging function is beyond the scope of this standard. (OK with KC)
37	11.2.2.1	PMK	e		Last para: "destination station is Power State Save mode	"destination station is in the Power State Save mode."	Done
38	11.2.2.1	KC	t	Y	The physical event that is tied to Target Beacon Time is not specified. Is it the start of the preamble? The point at which the MAC checks for medium availability or what?	Specify exact algorithm.	WITHDRAWN: (OK with KC)
39	11.2.2.1 1st ¶	TLP	e		Last use of "shall" is incorrect, since the verb is being used to describe necessity and intent, not a requirement.	Change "shall remain" to "needs to remain"	Accepted
40	11.2.2.1 2nd ¶	TLP	e		This augmentation seems to be necessary because this standard, for some obscure reason, treats broadcast (multicast to all) frames as if they were not multicast frames. It is as if one were to say that a rule applied to multi-person groups, and also to the group of all persons, implying that the latter was somehow not an instance of the former. In any event, be consistent. Since the committee seems to feel that broadcast is somehow not multicast, thus requiring explicit inclusion at each reference, please do the same here.	Change "multicast" to "broadcast/multicast"	Removed the qualification.
41	11.2.2.1 3rd ¶	TLP	e, t		The existing text states that MSDUs are randomized, when the randomization actually applies to the instant of transmission of the MSDUs; the MSDUs have prescribed contents which is anything but random. Also, the specified procedure lacks a reference.	Change the last sentence to read "Transmissions of MSDUs announced by ATIMs are randomized after the ATIM Window, using the backoff procedure described in clause 9."	ACCEPTED: editorial only.

42	11.2.2.1	WD	t		This section describes that in the ATIM window also Multicast frames shall be transmitted. This is not correct. The ATIM frame can have a multicast address, to announce multicast frames, but the frame itself should be send outside the ATIM window. This then is also consistent with item d of section 11.2.2.4.	The ATIM Window is defined as a specific period of time, defined by aATIMWindow, following a TBTT during which only Beacon, or ATIM or multieast frames shall be transmitted.	What is the desired operation? Ask the group.
43	11.2.2.1	WD	Т	Y	This section specifies that the ATIM transmission times are to be randomized using the backoff procedure, but with the contention window set to aCWmax. This is considered a far to wide range, especially considering that the randomization of the Beacon frame (which is not acknowledged) is specified to be in a range till twice aCWmin as specified in section 11.1.2.2. In an IBSS each station will try to send a Beacon untill another one is recognised. The collision probability between those Beacons is then directly proportional to the number of stations participating in the IBSS. The probability that ATIM frames are being transmitted, and so the collision probability of such frames is worst case identical to the collision probability of the Beacons, but is usually much less, because it depends of the traffic load generated simulataneously by all stations. Further all directed ATIMs are acknowledged, so a collision would result in a retransmission of the ATIM. The randomization range for ATIM transmissions should be specified equal to the normal aCWmin. This then is also consistent with item b of section 11.2.2.4. This should be sufficient considering that a collision will result in a retransmission of the ATIM.	ATIM transmission times are randomized, after a Beacon frame is either transmitted or received by the station, using the backoff procedure with the contention window equal to aCWminmax.	ACCEPTED: as is (OK with WD)
44	11.2.2.1	WD	t		The specification of the ATIM window is inconsistent	Update Annex. D accordingly.	ACCEPTED:

					Response with a status value of "successful" frame is acknowledged by the station, the station is considered to be associated with this Access Point. c) The AP shall inform the Distribution System of the reassociation.		
51 11.3.1, 11.3.2, 11.3.3, 11.3.4, and 11.1.3.2 .1, also 8.1.1.2, 8.1.2.2, 8.1.2.3, 8.1.2.4	MAF	t	(na)	There is nothing specified, either procedurally or in the MAC MIB to define an upper bound on the response time for Management frames other than Probes. There is a risk that conformant implementations might not be interoperable in the absence of of such a bound on the time before the responding station attempts to send Association Response frames, Reassociation Response frames, and Authentication frames (for the 2nd through last frames of any defined authentication sequence). The problem could occur in a case where an AP (or other responder STA in the case of Authentication sequences) is implemented in such a manner that it will never respond to one or more of these request types within the time that some STA implementation considers a reasonable maximum waiting time for such a response. For power-managed stations, waiting "forever" is a poor alternative. I strongly recommend that we apply the time limits already in the MIB for aMinProbeResponseTime and aMaxProbeResponseTime to the request/response exchanges for Association, Reassociation, and Authentication (for each step in the authentication sequence), as well as for Probe (already specified in 11.1.3.2.2). There also needs to be a constraint that	Clause 11.3.1: A station shall associate with an Access Point via the following procedure: a) The station shall transmit an Association Request to an Access Point with which that station is authenticated. b) If an Association Response frame is received with status value of "successful", the station is now associated with the Access Point. If the Association Request fails for any reason, the station may scan for a different Access Point with which to attempt association. The station may treat a period of at least a MaxProbeResponseTime duration following the transmission of an	Partially ACCEPTED: The changes related to the station were accepted and the text addopted. 91	11.4.4.2 .11 .12	TLP	e		change to literate English	Change "received to a RTS" to "received in response to an RTS"	Accepted
92	11.4.4.2 .13	TLP	e		change to literate English	Change "received to a" to "received in response to a"	Accepted
93	11.4.4.2	TLP	e		The deleted text is unnecessary as it is already excluded by the corrected text of aGroupAddresses. Its presence implies inconsistent requirements on the set aGroupAddresses.	Delete the clause ", the destination MAC address is not the broadcast address"	Accepted
94	11.4.4.2 .21 .33 many others	TLP	Е	Yes	Please take pity on non-native English speakers and use names that they have some slight chance of understanding. "suprt" for "supported" is not even close to acceptable. I am NO-voting the PHY clause of this standard for this reason (gross inconsiderateness). Therefore I am also correcting the names of PHY attributes which occur in this clause to a form that is acceptable to me (and I'm sure other intended readers); I will not be annotating the reason for each such correction.	Change "aSuprtDataRates" to "aSupportedDataRates", and "aMPDUMaxLngth" to "aMPDUMaxLength". (See supplied revision-marked files for addition corrected attribute names.)	Accepted
95	11.4.4.2	TLP	е		The relevant subset of frame types was specified incorrectly or not at all.	Change the third and fourth sentences to read "Setting this attribute to be larger than the maximum MSDU size shall have the effect of turning off the RTS/CTS handshake for all Data frames transmitted by this station. Setting this attribute to zero shall have the effect of turning on the RTS/CTS handshake for all Data frames transmitted by this station."	accepted

129	11.all all sections	TLP	e		MS Word superscript and subscript font attributes produce unacceptable results.	Do not use MS-Word subscripting or superscripting; MS-Word makes the resulting text TOO SMALL. Instead, select the characters to become the subscript or superscript and use Format/Font/Font/Size/8 and Format/Font/Character Spacing/Position/Lowered and Format/Font/Character Spacing/By/2 for a subscript, and Format/Font/Font/Size/8 and Format/Font/Character Spacing/Position/Raised and Format/Font/Character Spacing/By/3 for a superscript. (This is corrected in the submitted	Accepted
130	11.1.3.2	vh			for Keith Amundsen Active Scanning Procedure. For a frequency hopping PHY, active scanning consists of trying to communicate via probe and probe responses on each frequency channel. For acquisition, it it desireable to minimize the time needed to sit on each channel before stepping to the next one.	revision-marked files. To increase the probability of Probes and Probe Responses being transmitted in a timely fashion (before timeout of aMinProbeResponseTIme), these messages should employ a shorter contention window that that used for other messages. This would bias access to the medium in favor of probes and probe responses before other messages. A contention window of 3 slots is suggested for probes and probe responses.	REJECTED: at the plenary. (OK with Keith).
