Re:	80216h-06_011: Working Group Review: P802.16h Working Document (2006-04-07)	
Abstract	Procedure in community Entry of new BS	
Purpose	Comment on 15.2.1.3 Procedure in community Entry of new BS	
Notice	This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.	
Release	The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.	
Patent Policy and Procedures	The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures < http://ieee802.org/16/ipr/patents/policy.html >, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair < mailto:chair@wirelessman.org > as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site < http://ieee802.org/16/ipr/patents/notices >.	

1 15.2.1.3 Community Entry of new BS

2 *[Change the following section as indicate:]*

3 (1) Initialization stage

4 In initialization stage the ~~LE~~-BSs may avoid the co-channel or adjacent channel interference by scanning the available
5 frequencies. But this method cannot avoid the *hidden LE-BS-neighbor system* problem, i.e. the BS that cannot be heard
6 directly but may have overlapping service coverage. Thus, with the knowledge of coexistence neighbor topology the ~~LE~~
7 IBSs can detect the *hidden LE-BSs neighbor systems* and can, therefore, avoid the possible interferences from ~~coexisting~~
8 ~~coexistence~~-neighbors.

9 Alternatively, if the country/region database is not valid in this phase, the initializing BS will use the initialization
10 ~~coexistence-time slot signaling interval (ICSI)~~ to broadcast its IP-address-contact information to its coverage using its
11 maximum power. In this way, the SSs in the reachable zone of the new BS's interference will receive the signalingmessage
12 and forward the address-contact information to its serving BS. And after the neighbor BSs get the address via the SSs'
13 reports, they will contact with their new coming neighbor via IP network and updating the database on both side. Thus, in
14 ad-hoc fashion, it will ~~avoid-solve~~ the hidden neighbor ~~BS-issue-problem~~ by the SSs in the neighbor ~~network-system~~.
15 Therefore, using the information that the IBS has got from its neighbor, IBS can get the information of the relative
16 collaborative systems in potential community.-

17 If the ~~LE~~-IBS finds that there is no "free" channel ~~exist~~, the ~~coexistence-neighbor-topology-information~~ in the ~~share~~
18 ~~distributed~~ database ~~provides-the-information-of-can-be-used-to-figure-out~~ with whom it should negotiate with. ~~LE~~-IBS may
19 decide whether a "free" frequency can be allocated for itself by channel reallocation within community, If IBS can figure
20 out optimized channel distribution in the community, which made every member in the community could occupy a
21 exclusive channel, IBS ~~should-can~~ contact the BSs in the community which need to reallocate the channel ~~in-the-new~~
22 ~~distribution~~ and negotiate, after ~~admitted-confirmed~~ by ~~each-every-candidate~~ BS, IBS will vacate a exclusive channel for its
23 system. After that it should send a CP message to the candidate BS to indicate the ~~switch-time-and-the-target-channel~~
24 ~~succeeding~~, all the candidate BS should then ~~follow-the-indication-and-switch-to-the-target-continue-operation-on-the-new~~
25 channel ~~synchronously~~. Otherwise, if IBS can't get a "free" frequency ~~after-the-effort-of-whatever~~-reallocation ~~executed~~, ~~that~~
26 ~~means-the~~ IBS should ~~have-to-try-to~~ share a frequency with ~~one-or~~ some of its neighbors.

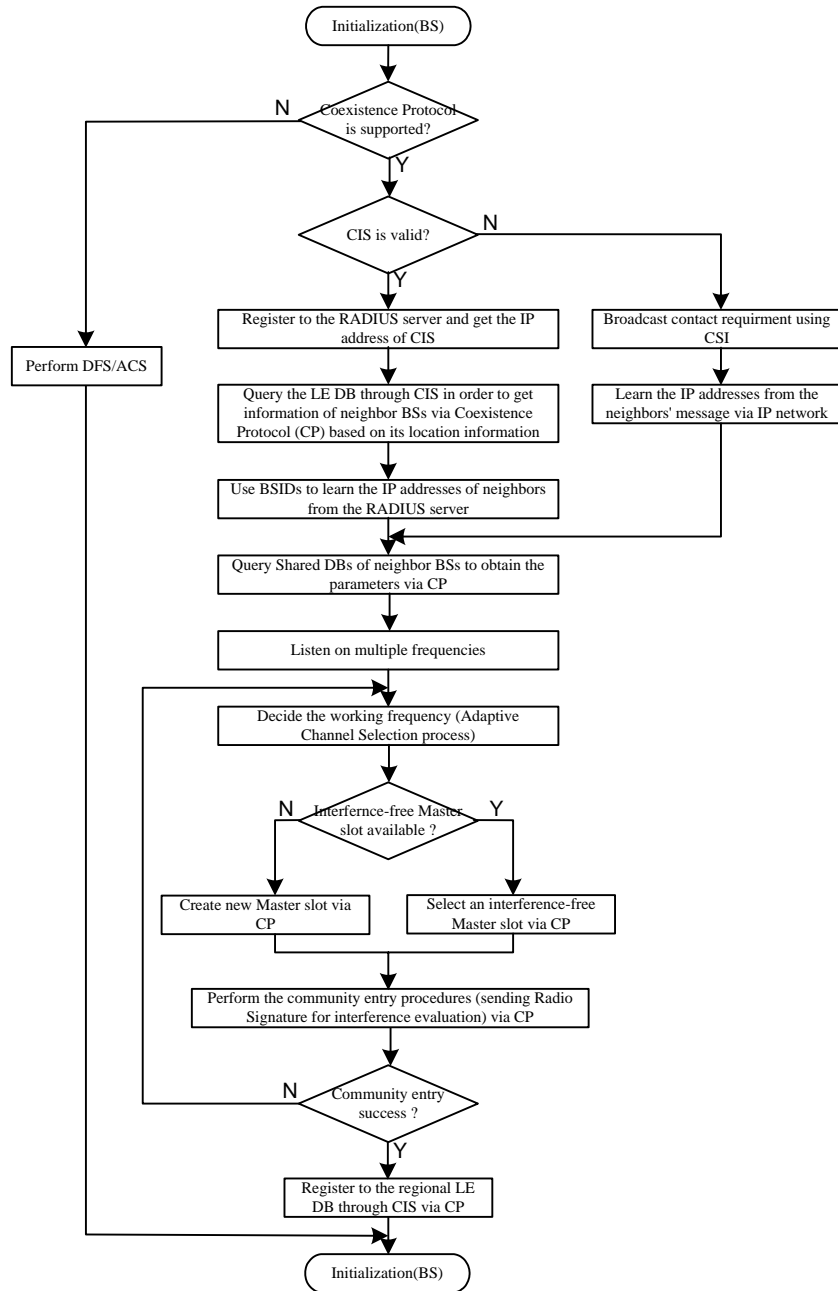

27 Similar to the channel allocation, the IBS will then first try to find a vacant sub-frame in the potential channels using the
28 information inside the distributed database, when failed IBS will then try to vacate an exclusive existing sub-channel by
29 sub-frame distribution optimization if supported. If a exclusive existing sub-channel is not available, IBS will then try to
30 negotiate with the systems inside the community to create a new sub frame. While all these attempt failed, the IBS will not
31 be able to get any interference free resource in its interference situation. These procedures are described in **Error!**
32 **Reference source not found. Figure h22.**

33 (2) Operating stage

34 In the operating stage, the ~~LE~~-BS has SSs associated with it, however, ~~untileven~~-the operating system parameters are
35 ~~determined-has-decided~~, the co-channel or adjacent channel interference from LE BSs of different network may still occur
36 ~~have-a-chance-to-happen~~ due to the detection of interference from primary user, ~~-_e~~Channel switching of coexistence
37 neighbor ~~BS-systems~~ or the entry of new coexistence neighbor BS might ~~makes~~ the community so crowded that there is no
38 enough channels. If the LE BS finds that there is no "free" channel at that moment, synchronous channel switching maybe
39 executed, or the coexistence neighbor topology provides the guidelines of with whom it should negotiate to share the
40 channel. *[detailed procedures are to be defined]*

41 **Error! Reference source not found. Error! Reference source not found.** shows the initialization procedures for the
42 802.16 LE BSs. Note that the procedures that BS tries to create a Master slot or channel switching are also applicable for

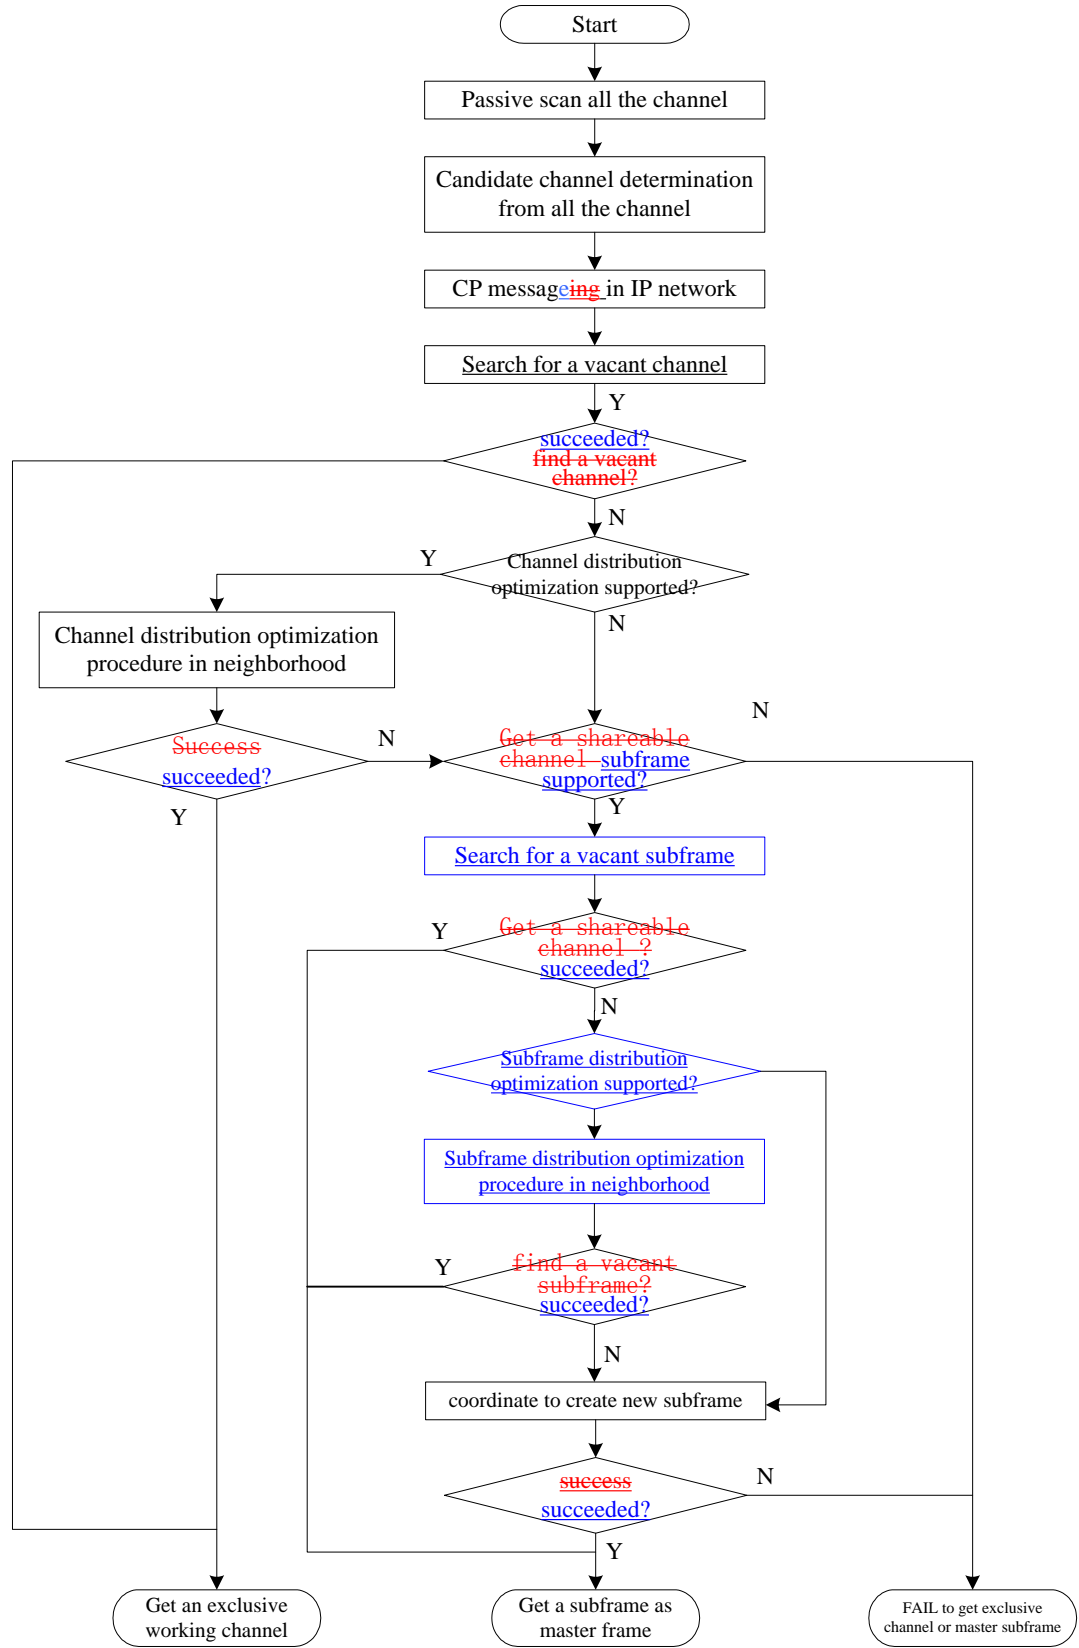

1 operating stage. The detailed negotiation and update procedures are described in section **Error! Reference source not**
2 **found**, and **Error! Reference source not found**.
