

Fixing Priority Encoding in 802.16k

IEEE 802.16 Presentation Submission Template (Rev. 8.3)

Document Number:

IEEE C802.16k-06/001

Date Submitted:

2006-07-19

Venue:

July 2006, IEEE 802.16 Session #44, San Diego, CA.

Base Document:

IEEE C802.16-06/001 <http://iee802.org/16/docs/06/C80216-06_001.pdf>

Purpose:

Correct the encoding of user_priority and access_priority in the M_UNITDATA.req primitive onto 802.16 frames

Notice:

This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release:

The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.

IEEE 802.16 Patent Policy:

The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures <<http://iee802.org/16/ipr/patents/policy.html>>, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair <<mailto:chair@wirelessman.org>> as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site <<http://iee802.org/16/ipr/patents/notices>>.

Priority Encoding Now

- user_priority and access_priority are passed to us on a M_UNITDATA.req from bridge or L3 stack (802.1D 6.4.1).
- They are encoded into the ISSP as follows:

What's wrong..

- `access_priority` on the `M_UNITDATA.req` is computed by a bridge as a function of the `user_priority`.
- In 802.16 this is a 1:1 mapping, so `access_priority == user_priority`;
- So encoding both priorities is redundant

Solution

- Replace ISSP with Priority byte
- Encode priority as a 3 bit value
- Encode in 3 MSBs to allow lower significance bits to have effect in the future

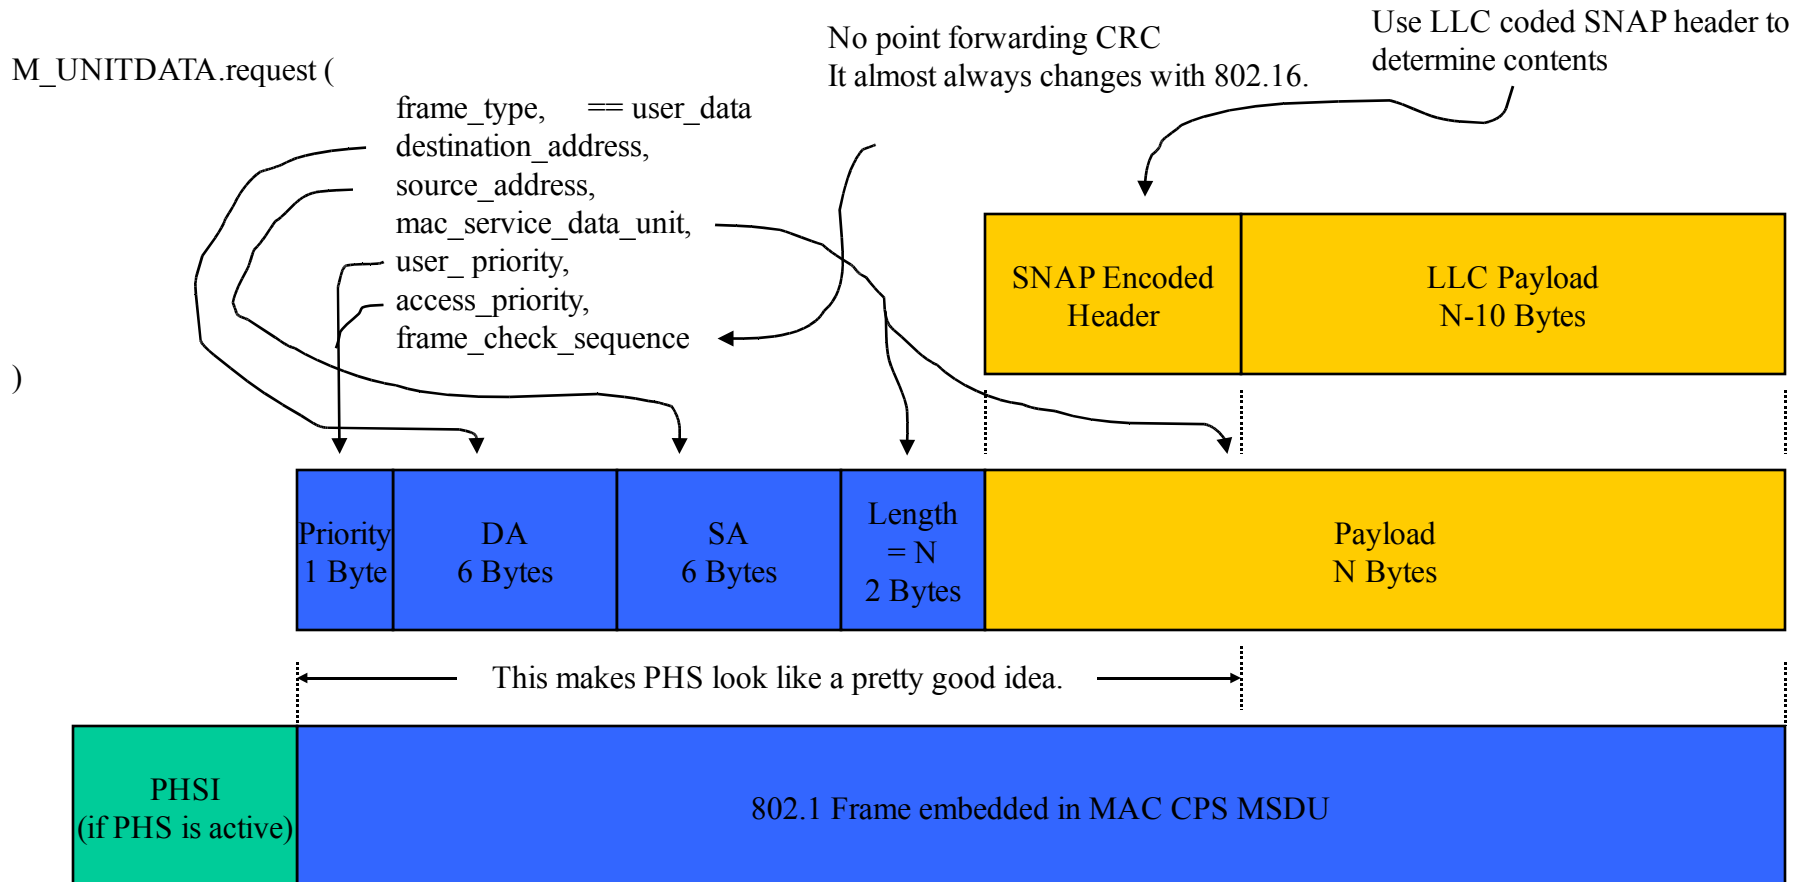

Behaviour

- On M_UNITDATA.req, access_priority is encoded in priority field of the priority byte of the 802.1 CS payload header
- On M_UNITDATA.ind, user_priority takes its value from the 3 bit priority field on the priority byte of the 802.1 CS payload header.

I.E.

- Primitive Parameter Mappings – 802.1 CS

Specific Text: Changes 6.5.5.2

- Change
 - The **user_priority** parameter of the M_UNITDATA primitive is not encoded in the MAC CPS MSDU as described in 6.5.5.2.1.1. **encoded directly in the ISSP byte of the the MAC CPS MSDU as described in 6.5.5.2.1.1.**

Specific Text: Changes 6.5.5.2

- Change
 - The **access_priority** parameter found in the M_UNITDATA.request primitive is encoded directly in the Priority**ISSP** byte of the MAC CPS MSDU as described in 6.5.5.2.1.1.

Specific Text Changes: Figure 6-2

- Change
 - ISSP to Priority

Specific Text Changes 6.5.5.2.1.1

- Change

- The **ISS** Priority byte (**ISSP**) shown in Figure 6-2 is a 1 byte encoding of the **user_priority** and **access_priority** parameters from the M_UNITDATA.request primitive.
- The value of the **user_priority****access_priority** parameter is encoded as a three bit number in bits 6, 7 and 8 of the **priority****ISSP** byte, where bit 8 of the **priority** is the most significant bit of the **access_priority** parameter and bit 6 of the **priority** the least significant bit of the **access_priority** parameter .

- Strike

- The value of the **access_priority** parameter is encoded as a three bit number in bits 3, 4 and 5 of the ISSP byte, where bit 5 is the most significant bit and bit 3 is the least significant bit.

- Change

- Bits **1 and 2** 1 through 5 of the **priority****ISSP** byte are reserved and shall each be 0.
