

2004-12-03

IEEE 802.16g-04/03, December 2004

Baseline Document for Draft IEEE Standard for Local and metropolitan area networks

Part 16: Air Interface for Fixed and Mobile Broadband Wireless Access Systems

Amendment to IEEE Standard for Local and Metropolitan Area Networks - Management Plane Procedures and Services

Sponsor

LAN MAN Standards Committee
of the
IEEE Computer Society

and the

IEEE Microwave Theory and Techniques Society

~~**Abstract:** This standard defines Management Procedures as enhancements to the IEEE 802.16 air interface standard for fixed and mobile broadband wireless systems. It specifies the management functions, interfaces and protocol procedures.~~

Keywords: fixed broadband wireless access network, mobile broadband wireless access network, metropolitan area network, microwave, millimeter wave, management, WirelessMAN™ standards

No part of this publication may be reproduced in any form, in an electronic retrieval system or otherwise, without the prior written permission of the publisher.

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied “**AS IS.**”

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board

USA

Note: Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

Authorization to photocopy portions of any individual standard for internal or personal use is granted by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright Clearance Center. To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

Introduction

~~(This introduction is not part of IEEE Draft P802.16g, Draft Amendment to IEEE Standard for Local and Metropolitan Area Networks Part 16: Amendment to IEEE Standard for Local and Metropolitan Area Networks Management Plane Procedures and Services.)~~

Participants

~~This document was developed by the IEEE 802.16 Working Group on Broadband Wireless Access, which develops the WirelessMAN™ Standard for Wireless Metropolitan Area Networks.~~

IEEE 802.16 Working Group Officers

Roger B. Marks, *Chair*

Ken Stanwood, *Vice Chair*

Dean Chang, *Secretary*

Primary development was carried out by the Working Group's Task Group g:

TGg Officers

Phillip Barber, *Chair*

Changhoi Koo, *Vice Chair*

Itzik Kitroser, *Vice Chair*

Jose Puthenkulam, *Chief Technical Editor*

The following members of the IEEE 802.16 Working Group on Broadband Wireless Access participated in the Working Group Letter Ballot in which the draft of this standard was prepared and finalized for IEEE Ballot:

[to be determined]

The following participated as non-members in the Working Group Letter Ballot:

[to be determined]

The following members of the IEEE Balloting Committee voted on this standard, whether voting for approval or disapproval, or abstaining.

[to be determined]

The following persons, who were not members of the IEEE Balloting Committee, participated (without voting) in the IEEE Sponsor Ballot in which the draft of this standard was approved:

[to be determined]

When the IEEE-SA Standards Board approved this standard on *[date]*, it had the following membership:

[to be determined]

Also included is the following nonvoting IEEE-SA Standards Board liaison:

[to be determined]

This draft is intended for IEEE-SA Sponsor Ballot with individuals as the ballot group members.

37 NOTE-The editing instructions contained in this amendment define how to merge the material contained
38 herein into the existing base standard IEEE Std 802.16-2004.
39
40

41 The editing instructions are shown *bold italic*. Four editing instructions are used: *change*, *delete*, *insert*, and
42 *replace*. *Change* is used to make small corrections in existing text or tables. The editing instruction specifies
43 the location of the change and describes what is being changed by using strike through (to remove old mater-
44 ial) and underscore (to add new material). *Delete* removes existing material. *Insert* adds new material with-
45 out disturbing the existing material. Insertions may require renumbering. If so, renumbering instructions are
46 given in the editing instruction. *Replace* is used to make large changes in existing text, subclauses, tables, or
47 figures by removing existing material and replacing it with new material. Editorial notes will not be carried
48 over into future editions because the changes will be incorporated into the base standard.
49
50
51

52
53 **1. Introduction**
54

55 **Scope:** This document provides enhancements to the MAC and PHY management entities of IEEE Standard
56 802.16-2004, as amended by P802.16e, to create standardized procedures and interfaces for the management
57 of conformant 802.16 devices.
58

59 **Purpose:** The purpose of this project is to provide conformant 802.16 equipment with procedures and ser-
60 vices to enable interoperable and efficient management of network resources, mobility, and spectrum, and to
61 standardize management plane behavior in 802.16 fixed and mobile devices.
62

IEEE 802.16a-2003, "IEEE Standard for Local and Metropolitan area networks - Part 16: Air Interface for Fixed Wireless Access Systems - Amendment 2: Medium Access Control Modifications and Additional-Physical Layer Specifications for 2-11 GHz.

IEEE 802.16-2004, "IEEE Standard for Local and Metropolitan area networks - Part 16: Air Interface for Fixed Broadband Wireless Access Systems", October, 2004

IEEE P802.16e-D5, "Draft IEEE Standard for Local and Metropolitan area networks - Part 16: Air Interface for Fixed and Mobile Broadband Wireless Access Systems", October, 2004

4. Abbreviations and acronyms

[Insert the following abbreviations and acronyms into the the text as specified below]

IRP - Integration Reference Point

NRM - Network Reference Model

MIB - Management Information Base

[Insert a new chapter 14 and then insert the text specified below]

14. Management Interfaces and Procedures

14.1 Overview

The 802.16 devices within the purview of this specification can include 802.16-2004 subscriber stations (SS) or 802.16e mobile subscriber stations (MSS) or base stations (BS). As the 802.16 devices may be part of a larger network and therefore would require interfacing with entities for management and control purposes, this document assumes a Network Control and Management System (NCMS) abstraction that interfaces with the base stations. The NCMS abstraction allows the PHY/MAC/CS layers specified in 802.16 to be independent of the network architecture, the transport network, and the protocols used at the backend and therefore allows greater flexibility on the network side. Any necessary inter-BS coordination is handled through the NCMS. This specification will only describe procedures for management and control interactions between the MAC/PHY/CS layers of the 802.16 devices and the NCMS. The details of the various entities that form the Network Control and Management System are outside the purview of this specification. An abstracted network reference model is presented to clearly depict the interfaces that are assumed to be in scope of the specification.

14.2 Requirements

<Section Notes: This section describes the functional requirements that need to be addressed by the 802.16g specification. However this section is purely informational and meant to guide the development of this document.>

14.3 Information Model Concepts

14.4 Architectural Aspects

<Section Notes: This section describes the functional aspects of 802.16g and how the different management procedures are specified. >

14.4.1 Network Reference Model

The Figure 1 describes a network reference model along with the interfaces that are within the scope of this specification. Multiple SS or MSS may be attached to a BS. The SS communicate to the BS over the U interface using a Primary Management Connection or a Secondary Management Connection. MSS typically only utilize the Primary Management Connection over the U interface for management and related control functions.

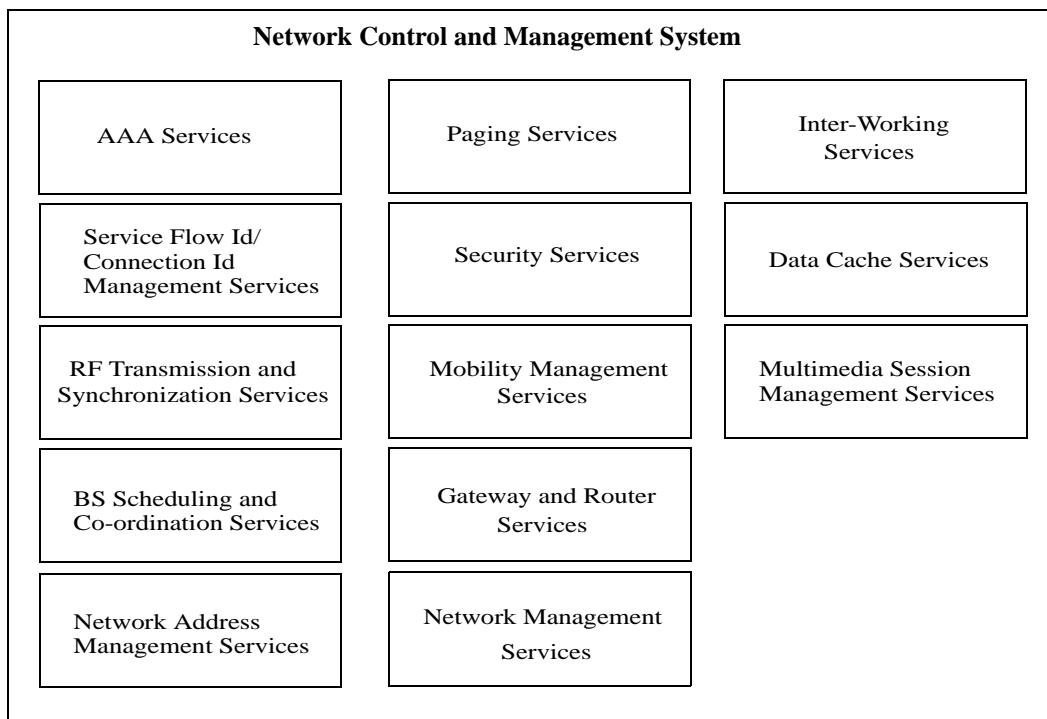

Figure 1—Logical Network Reference Model (Informational)

14.4.1.1 Network Control and Management System (NCMS)

This abstraction is detailed in Figure 2 to show the different entities that make up such a Network Control and Management System. The exact functionality of these entities and their services is outside the scope of this specification but shown here for illustration purposes and to better enable the description of the management and control procedures.

30 **Figure 2—Illustration of the Network Control and Management System (Informational)**

31
32
33 **14.4.1.1.1 SS/MSS and BS Interface**

34
35 This U interface may be implemented using either a primary management connection or a secondary management connection

36
37
38
39 **14.4.1.1.2 BS and NCMS Interface**

40
41 This interface is logically decomposed in to two parts: the M interface used for Management procedures alone and the R interface used for Control plane procedures that to support handovers, security context management, radio resource management, and low power operations (such as Idle mode and paging functions). Protocol procedures on both M and R interfaces are described in a transport independent manner.

42
43
44
45
46
47 The M interface may include messages for procedures related to:

- 48
49
- 50 • -System configuration
 - 51 • -Monitoring Statistics
 - 52 • -Notifications/Triggers

53
54
55 The R interface may include the messaging required for procedures related to:

- 56
57
- 58 • -Handovers (e.g. notification of HO request from MSS, etc.)
 - 59 • -Idle mode mobility management (e.g. Mobile entering idle mode)
 - 60 • -Subscriber and session management (e.g. Mobile requesting session setup)
 - 61 • -Radio resource management, etc.

1 The interactions over the R interface can be bi-directional and not necessarily master-slave with the NCMS
2 acting as master. The interaction may be of a request-response nature, in which a request from one side trig-
3 gers a procedure on the other side in order to generate the response.
